## I THE NATURE OF THE SYNTOPICON

By calling this work "a Syntopicon of *Great Books of the Western World*" the editors hope to characterize its nature to indicate the function it performs in relation to the set as a whole and to assert its originality as an intellectual instrument. The relation of these two volumes of *The Great Ideas* to the rest of the set is the key to the nature of the Syntopicon and its originality as an instrument. Apart from this relation *The Great Ideas* though to some extent readable in itself does not perform the function for which it was created—to show that the 443 works which comprise Volumes 4 to 54 can be seen and used as something more than a collection of books.

The great books are pre-eminently those which have given the western tradition its life and light. The unity of this set of books does not consist merely in the fact that each member of it is a great book worth reading. A deeper unity exists in the relation of all the books to one tradition, a unity shown by the continuity of the discussion of common themes and problems. It is claimed for this set of great books that all the works in it are significantly related to one another and that taken together they adequately present the ideas and issues, the terms and topics, that have made the western tradition what it is. More than a collection of books then this set is a certain kind of whole that can and should be read as such.

*The Great Ideas* results from and records such a reading of the great books. The aim of this syntopical reading was to discover the unity and continuity of western thought in the discussion of common themes and problems from one end of the tradition to the other. The Syntopicon does not reproduce or present the results of this reading in a digest to save others the trouble of reading the great books for themselves. On the contrary it only lays down the lines along which a syntopical reading of the great books can be done, and shows why and how it should be done. The

# PREFACE

## I THE NATURE OF THE SYNTOPICON

By calling this work "a Syntopicon of Great Books of the Western World" the editors hope to characterize its nature to indicate the function it performs in relation to the set as a whole and to assert its originality as an intellectual instrument. The relation of these two volumes of *The Great Ideas* to the rest of the set is the key to the nature of the Syntopicon and its originality as an instrument. Apart from this relation *The Great Ideas* though to some extent readable in itself does not perform the function for which it was created—to show that the 443 works which comprise Volumes 4 to 54 can be seen and used as something more than a collection of books.

The great books are pre-eminently those which have given the western tradition its life and light. The unity of this set of books does not consist merely in the fact that each member of it is a great book worth reading. A deeper unity exists in the relation of all the books to one tradition a unity shown by the continuity of the discussion of common themes and problems. It is claimed for this set of great books that all the works in it are significantly related to one another and that taken together they adequately present the ideas and issues, the terms and topics, that have made the western tradition what it is. More than a collection of books, then, this set is a certain kind of whole that can and should be read as such.

*The Great Ideas* results from and records such a reading of the great books. The aim of this "syntopical reading" was to discover the unity and continuity of western thought in the discussion of common themes and problems from one end of the tradition to the other. The Syntopicon does not reproduce or present the results of this reading in a digest to save others the trouble of reading the great books for themselves. On the contrary it only lays down the lines along which a syntopical reading of the great books can be done and shows why and how it should be done. The

them the further utility of a unified reference library in the realm of thought and opinion.

Because of the traditional and proved importance of the thought and vision contained in the great books, the *Syntopicon* in the editors opinion creates an intellectual instrument which is comparable to though quite distinct from, the dictionary and the encyclopaedia. The dictionary is a basic reference work in the sphere of language. The general encyclopaedia is a basic reference work in the sphere of fact, concerned with all matters ascertainable in the present state of historical and scientific knowledge. The *Syntopicon*—these two volumes taken together with the rest of the set—is a basic reference work in the sphere of ideas, comprehending the wisdom and understanding accumulated thus far in all major fields of inquiry. As its utility is realized it will, the editors hope, take its place beside the dictionary and the encyclopaedia in a triad of fundamental reference works.

## II THE STRUCTURE OF THE SYNTOPICON

*The Great Ideas* consists of 102 chapters, each of which provides a syn-topical treatment of one of the basic terms or concepts in the great books. As the Table of Contents indicates, the chapters are arranged in the alphabetical order of these 102 terms or concepts from *ANCESTOR* to *LOVE* in Volume I and from *MAN* to *WORLD* in Volume II.

Following the chapter on *World* there are two appendices. Appendix I is a Bibliography of Additional Readings. Appendix II is an essay on the Principles and Methods of Syntopical Construction. These two appendices are in turn followed by an Inventory of Terms.

### THE 102 CHAPTERS

Each of the 102 chapters is constructed according to the same pattern. Each consists of five parts—an Introduction, an Outline of Topics, References, Cross-References, and Additional Readings. The inner structure of the *Syntopicon* is constituted by the order and relation of these five parts and by the integral relation of the Inventory of Terms to the 102 chapters as a whole.

various uses of the *Syntopicon*, described in Section III of this Preface, all derive from its primary purpose—to serve as 1 guide to the reading of *Great Books of the Western World* as 1 unified whole

The lines along which a syntopical reading of the great books can and should be done are the main lines of the continuous discussion that runs through the thirty centuries of western civilization. This great conversation across the ages is a living organism whose structure the *Syntopicon* tries to articulate. It tries to show the many strands of this conversation between the greatest minds of western civilization on the themes which have concerned men in every epoch, and which cover the whole range of man's speculative inquiries and practical interests. To the extent that it succeeds, it reveals the unity and continuity of the western tradition.

It was with these considerations in mind that the editors called *The Great Ideas* a *syntopicon* of the great books—literally, a collection of the topics which are the main themes of the conversation to be found in the books. A topic is a subject of discussion. It is a place at which minds meet—to agree or disagree, but at least to communicate with one another about some common concern. Just as a number of minds, or what they have to say, can be related by their relevance to a common theme, so a number of topics can be related by their relevance to a common term—a single concept or category which generates a number of problems or themes for discussion. Hence the *Syntopicon* is organized first, by a listing of the ideas that are the important common terms of discussion, and, then by an enumeration of the topics that are the various particular points about which the discussion of each of these ideas revolves.

The full title of this work—*The Great Ideas a Syntopicon of Great Books of the Western World*—thus indicates not only that its structure consists of terms and topics, but also that it functions as a guide to the great books from which its terms and topics are drawn. But the title may fail to indicate another equally important function which the *Syntopicon* performs when it is taken together with the great books. By serving as a guide to the syntopical reading of the great books, it does more than transform them from a mere collection of books into a unified whole; it transforms them into a new kind of encyclopaedic whole—a new kind of reference library. Without in any way interfering with all the values the great books have as books to be read individually, the *Syntopicon* gives

them the further utility of a unified reference library in the realm of thought and opinion.

Because of the traditional and proved importance of the thought and opinion contained in the great books, the *Syntopicon* in the editors opinion creates an intellectual instrument which is comparable to though quite distinct from the dictionary and the encyclopaedia. The dictionary is a basic reference work in the sphere of language. The general encyclopaedia is a basic reference work in the sphere of fact, concerned with all matters ascertainable in the present state of historical and scientific knowledge. The *Syntopicon*—these two volumes taken together with the rest of the set—is a basic reference work in the sphere of ideas, comprehending the wisdom and understanding accumulated thus far in all major fields of inquiry. As its utility is realized it will the editors hope, take its place beside the dictionary and the encyclopaedia in a triad of fundamental reference works.

## II THE STRUCTURE OF THE SYNTOPICON

*The Great Ideas* consists of 102 chapters, each of which provides a synoptical treatment of one of the basic terms or concepts in the great books. As the Table of Contents indicates, the chapters are arranged in the alphabetical order of these 102 terms or concepts from ANGEL to LOVE in Volume I and from MAN to WORLD in Volume II.

Following the chapter on WORLD there are two appendices. Appendix I is a Bibliography of Additional Readings. Appendix II is an essay on the Principles and Methods of Syntactical Construction. These two appendices are in turn followed by an Inventory of Terms.

### THE 102 CHAPTERS

Each of the 102 chapters is constructed according to the same pattern. Each consists of five parts—an Introduction, an Outline of Topics, References, Cross-References, and Additional Readings. The inner structure of the *Syntopicon* is constituted by the order and relation of these five parts and by the integral relation of the Inventory of Terms to the 102 chapters as a whole.

(1) *INTRODUCTION* Each chapter begins with an essay which comments on the various meanings of the idea under consideration, and takes note of the problems it has raised and the controversies it has occasioned in the tradition of western thought

The Introduction to a great idea is designed to serve as a guide to its topics and, through them, to the content of the references. For certain of the most important topics, it frequently provides, in the words of the authors themselves, a foretaste of the great conversation contained in the passages referred to. The Introduction usually expands on the necessarily brief statement of the themes or issues in the Outline of Topics, and furnishes some comment on the structure of the Outline as a whole, and on the relation of particular topics to one another.

The Introduction serves one other purpose. It indicates some of the connections between the idea it discusses and other great ideas, thus functioning as a commentary on the Cross References. In some cases, the Introduction also calls attention to the way in which certain works recommended in the Additional Readings supplement the references to the great books in the discussion of certain aspects of the idea under consideration.

(2) *OUTLINE OF TOPICS* In each chapter, the Outline of Topics follows the Introduction. It states the major themes of the conversation to be found in the great books on the idea of that chapter. It exhibits the internal structure of the idea by presenting its topics in relation to one another. There are about 3000 topics in the *Syntopicon* as a whole, an average of 30 to a chapter though the actual number varies from as few as six topics in 1 chapter to as many as 76.

The 3000 topics provide a statement of the scope and variety of subjects with which the great books deal in a substantial and significant fashion. Since the topics are divided among 102 chapters according to the great ideas under which they fall, the user of the *Syntopicon* can find a particular topic by turning to the chapter on the idea which is a central term expressed in the statement of that topic or if not actually present in the phrasing of the topic is implied by it.

Almost all the topics involve one or more terms other than the name of the great idea under which they fall. Hence, by consulting the Inventory of Terms the user of the *Syntopicon* can ascertain whether the particular subject in which he is interested is represented by one or more of the 3000

topics. As will be seen below the prime function of the Inventory is to enable the user of the Syntopicon to find topics in which he is interested and which he could not otherwise find except by examining the Outlines of Topics, chapter by chapter.

Since the references to the great books are organized by topics, the individual topic, rather than a great idea is the elementary unit of the Syntopicon. From the standpoint of the references, the great ideas are collections of topics. The same is true of all the other terms listed in the Inventory of Terms. For each of these one or more topics are the headings under which the discussion of the subject can be found in the great books. The user of the Syntopicon must therefore, always use a topic rather than a term to discover what the great books have to say on a particular subject. However with the help of the Inventory of Terms, he can always use a term to find the topics which either state or approximately represent the subject of his interest.

For the convenience of the reader the Outline of Topics in each chapter is keyed to the pages of the Reference section which immediately follows. In the Outline, the number to the right of a particular topic indicates on which page of the Reference section it begins.

(3) REFERENCES The References are the heart of each chapter. As the Introduction and the Outline of Topics are designed to help the reader use the References, so the References, organized topically are designed to enable him to turn to the great books for the discussion of a particular subject. For each topic they locate, by volume and page the relevant works and passages in *Great Books of the Western World*. There are about 163,000 references in the Syntopicon as a whole, an average of 1500 to a chapter though the actual number varies from as few as 284 references in a chapter to as many as 7065.

Under each topic, the references are arranged in the order in which the authors and their works appear in *Great Books of the Western World*. References to the Bible when present are always placed first. The order of references enables the user of the Syntopicon either to follow the discussion of some theme through the great books in the historical sequence, or to select particular authors or the authors of a particular period according to his interest.

Ideally, a syntactical reading of the great books in relation to any single topic should cover all the works or passages cited under that topic. Ideally, such a reading should proceed, in the first instance at least, in the order in which the references are presented. Reading the materials in chronological order enables the reader to follow the actual development of thought on a topic. In many passages, later authors explicitly refer to earlier ones, and even more frequently, the expression of later views presupposes an understanding of earlier ones, on which they are based or with which they take issue.

But the individual reader may deviate from this ideal procedure in a number of ways, according to his particular interests. He may wish only to sample the materials referred to under a given topic, or he may wish to examine what a certain group of authors have to say on a particular topic. The reader may know sufficiently well the position of certain authors on the topic in question, and so may turn his attention to other authors whose works are cited there, or he may wish to examine thoroughly the thought of certain authors while merely forming a general impression of what others have to say. The Reference section is so constructed that it permits the reader, almost at a glance, to follow any one of a wide variety of procedures.

A brief explanatory note, repeated at the beginning of every Reference section, gives the minimum necessary directions for going from the references to the passages to which they refer. For the sake of brevity, it offers only such information as is uniform for all of the works cited. If the reader wishes complete information concerning the way in which each particular work is cited, he will find this set forth by authors and titles, in the Explanation of Reference Style, which immediately follows this Preface (see pg. xxxiii) and is also printed for the reader's convenience at the opening of Volume II. The Explanation of Reference Style contains a complete account of all the symbols and abbreviations used in the Reference section and gives examples of the usual typographical form of the references.

Only one further point requires comment here. In some chapters a few topics contain no references. These topics serve in the Outline as headings for other topics grouped analytically under them. The user of the Synopticicon who wants to know what the great books have to say on a particular subject, and finds that subject represented by a topic without reference

content will find in its subordinate topics references to the great books on various aspects of the general subject he has in mind.

(4) CROSS REFERENCES The Cross References follow the References in each chapter. They direct the reader to other chapters in which similar or related matters are considered. By relating the topics of one chapter to those of other chapters the Cross References show the interconnection of the great ideas.

In general the order of the Cross-References follows that of the Outline of Topics. Each entry in the Cross-References indicates by its phrasing the subject of the topic in a given chapter to which topics in other chapters are related or similar.

The phrasing of the Cross-References enables the reader to determine whether the topics in the other chapters mentioned are *similar* or *related* to the topic in this chapter. The *related* topics will usually offer a quite different set of references.

The user of the Syntopicon will find that topics in different chapters often resemble one another both in their phrasing and in the references set forth under them. In a few cases they are identical or almost identical. But *similar* topics will usually differ in their reference content because the meaning of a topic is partly determined by the idea under which it falls, and by the surrounding topics which form its context. Hence, in most cases the reader who turns to similar topics in other chapters will find some proportion of different references.

(5) ADDITIONAL READINGS *Great Books of the Western World* comprises 443 works by 74 authors. If we add the 77 books of the Bible which are syntopically treated along with these published works, the number is 50. But this large number does not represent all the books which make signal contributions to the great conversation in the sphere of each of the great ideas.

The list of Additional Readings which is the last part of each chapter is a list of books recommended as companions to the works and passages cited in the Reference section. For the ideas and topics of each chapter they supplement or amplify the discussion to be found in the great books. They represent some of the works in the wider field of literature, in which the great books occupy a central position.

In each list of Additional Readings, the recommended titles are divided into two groups first, works written by authors represented in *Great Books of the Western World*, and second, works by other authors Each group is listed chronologically Whenever they are available, translations of foreign works are suggested The existence of English translations is always indicated by the use of English titles, these are usually accompanied by the title in the original language

The 102 lists of Additional Readings, each constructed for the idea and topics of a particular chapter, contain in all 2603 titles by 1181 authors For the convenience of the reader, the authors and titles in the 102 separate lists of Additional Readings are compiled into a single list in the Bibliography of Additional Readings, which is Appendix I (see Volume II, pg 1143)

In the Bibliography of Additional Readings the authors names are in alphabetical order and the works of each author are listed alphabetically under his name In addition, the Bibliography provides useful information concerning authors and works, such as birth and death dates of authors, date and place of writing or publication, names of editors or translators, names of publishers, and names of standard collections in which individual works appear A note, preceding the Bibliography, explains the principles of its construction

#### THE INVENTORY OF TERMS

The Inventory of Terms is an integral part of the Syntopicon placed for convenience at the end of Volume II

The Syntopicon is both a book to be read and a reference book The Table of Contents sets forth its contents as a book to be read But since this is limited to listing the 102 great ideas chapter by chapter, it cannot indicate the scope and range of the Syntopicon as a reference book The Inventory of Terms performs that function, it serves as a table of contents for the Syntopicon as a reference book

The person who wishes to use the Syntopicon as a reference book, in order to learn what the great books have to say on a particular subject, must be able to find that subject among the 3000 topics The primary function of the Inventory of Terms is to enable him to find the topic or topics which either clearly express or approximately represent the subject of his inquiry It does so by citing for each term listed the topics in which that

term is a principal element. It cites these by giving the name of the chapter in which the topic appears, and the number of the topic in that chapter. The reader can find the topic in which he is interested by looking in the Inventory for the term or terms that would appear in a statement of the subject.

The user of the *Syntopicon* may have a broader interest than can be expressed in a particular topic. He may wish to examine the whole range of discussion of a basic concept whether that be one of the great ideas or some other term. This may involve, not one or two topics, but a large number as is certainly the case for the great ideas, and for many other important concepts as well. Since the *Inventory of Terms* cites all the topics in which each term is significantly involved it enables the reader to investigate the whole range of the discussion in the great books relevant to the term.

Among the terms listed in the *Inventory* are the names of the 102 great ideas. This does not duplicate the information furnished by the Table of Contents. For each of the great ideas, the Table of Contents locates only the whole chapter which deals with that great idea whereas the *Inventory of Terms* usually cites topics in many other chapters, in addition to the chapter on that idea itself. For the reader who wishes to explore the discussion of a great idea as thoroughly as possible, the *Inventory of Terms* supplements the topics to be found in the chapter on that idea and even those mentioned in the Cross-References of that chapter.

The 1800 terms in the *Inventory* are listed alphabetically and for each term the relevant topics are cited in the alphabetical order of the chapters in which the topics occur. Sometimes the topics are divided into two groups, of primary and secondary importance. Within each group the chapters are alphabetically arranged.

The *Inventory* is likely to present only one difficulty to the person who consults it in order to find a particular topic. The first step in the location of a topic is accomplished when the reader turns in the *Inventory* to the term that he thinks is involved in a statement of the subject of his interest. But finding a number of topics cited there, he must choose among them.

There are two ways for him to proceed (1) he can examine the topics one after another until he finds the one which satisfies him as a statement of the subject or (2) he can use the names of the chapters in which the topics occur as a clue to finding the topic which states the subject of

his inquiry Since the content of particular topics is largely determined by the idea under which they fall, the chapter names will quite frequently prove a reliable guide

A brief note, at the beginning of the Inventory of Terms, explains its construction and furnishes directions for its use Nothing more need be said here of its structure, or of its utility in making the Syntopicon a reference book But a word should be added about the significance of the Inventory in relation to the great ideas

The division of the Syntopicon into 102 chapters may give rise to the notion that its editors think there are only 102 ideas worth discussing The number of really great, that is, primary or pivotal ideas may be smaller or larger than 102 That number represents an editorial judgment which was made in the course of constructing the Syntopicon How it was reached is explained elsewhere (see Appendix II, Section I), but here it should be said that it does not represent a judgment by the editors that the 102 terms selected by them are the only concepts or ideas which have notable significance in the tradition of western thought The Inventory of Terms manifests exactly the opposite judgment Its 1800 words or phrases express important concepts Though many of these will immediately be seen to have much less comprehensive or critical meaning than the 102 major terms of the Syntopicon, they all have general currency or importance in some special field of inquiry They also represent notions or topics which fall under one or more of the 102 great ideas

#### THE PRINCIPLES AND METHODS OF SYNTOPICAL CONSTRUCTION

The essay on the Principles and Methods of Syntopical Construction is Appendix II (see Volume II, pg 1219) It is intended as a supplement to this Preface The foregoing brief descriptions of the parts of the Syntopicon indicate its structure, but they do not explain how it was constructed

The work of creating each part of the Syntopicon raised many difficult intellectual and editorial problems These problems and especially the principles and methods by which they were solved may be of interest to the reader after he has had some experience in using the Syntopicon but probably not before The editors decided to make the essay on the Syntopicon's construction an appendix to the work rather than burden the Preface with an account of the methods employed and an exposition of

the principles adopted. While freeing the Preface from the burden of fuller explanations they nevertheless hoped to provide systematic answers to questions which might arise in the reader's mind as a result of using the Syntopicon.

### III THE USES OF THE SYNTOPICON

The foregoing discussion of the nature and structure of the Syntopicon has expressed the purpose for which it was designed but it does not fully state all its possible uses. There are four basic types of usefulness which the editors hope the Syntopicon will have. Two of these have already been mentioned. It has been pointed out that the Syntopicon is both a reference book and a book to be read. But the Syntopicon is also intended to serve as an instrument of liberal education through the aid it can give to a certain kind of study and teaching of the great books. It is not inconsistent with its primary function as a reference book that it should in addition, prove to be an instrument of research and discovery.

#### (1) *The Syntopicon as a reference book.*

The description (in Section II of this Preface) of the parts of the Syntopicon and their function in the structure of the whole includes some indication of how it may be used as a reference book. Here we are concerned with its general character as a reference work as evidenced by the types of questions it has been constructed to answer.

In contradistinction to books of other sorts reference books are designed to help the reader who comes to them with inquiries on particular subjects. If in addition to answering the question he brings, they raise further questions in his mind and excite him to further inquiries which in turn they are able to satisfy, they are more than answer books. They are pedagogues leading the mind from question to question in the pursuit of learning. Reference books at their best perform an educational function no simply by answering questions but by arousing and sustaining inquiry.

Nevertheless the field of any reference book is defined in the first instance by the types of questions it is able to answer. The specific type of inquiry which the Syntopicon is able to satisfy and which gives it its special character as a reference book, can be formulated by the question *What*

his inquiry Since the content of particular topics is largely determined by the idea under which they fall, the chapter names will quite frequently prove a reliable guide

A brief note at the beginning of the Inventory of Terms, explains its construction and furnishes directions for its use Nothing more need be said here of its structure, or of its utility in making the Syntopicon a reference book But a word should be added about the significance of the Inventory in relation to the great ideas

The division of the Syntopicon into 102 chapters may give rise to the notion that its editors think there are only 102 ideas worth discussing The number of really great, that is, primary or pivotal ideas may be smaller or larger than 102 That number represents an editorial judgment which was made in the course of constructing the Syntopicon How it was reached is explained elsewhere (see Appendix II, Section I), but here it should be said that it does not represent a judgment by the editors that the 102 terms selected by them are the *only concepts or ideas which have notable significance in the tradition of western thought* The Inventory of Terms manifests exactly the opposite judgment Its 1800 words or phrases express important concepts Though many of these will immediately be seen to have much less comprehensive or critical meaning than the 102 major terms of the Syntopicon, they all have general currency or importance in some special field of inquiry They also represent notions or topics which fall under one or more of the 102 great ideas

#### THE PRINCIPLES AND METHODS OF SYNTOPICAL CONSTRUCTION

The essay on the Principles and Methods of Syntopical Construction is Appendix II (see Volume II, pg 1219) It is intended as a supplement to this Preface The foregoing brief descriptions of the parts of the Syntopicon indicate its structure, but they do not explain how it was constructed

The work of creating each part of the Syntopicon raised many difficult intellectual and editorial problems These problems, and especially the principles and methods by which they were solved, may be of interest to the reader after he has had some experience in using the Syntopicon, but probably not before The editors decided to make the essay on the Syntopicon's construction an appendix to the work, rather than burden the Preface with an account of the methods employed and in exposition of

the principles adopted. While freeing the Preface from the burden of fuller explanations they nevertheless hoped to provide systematic answers to questions which might arise in the reader's mind as a result of using the Syntopicon.

### III THE USES OF THE SYNTOPICON

The foregoing discussion of the nature and structure of the Syntopicon has expressed the purpose for which it was designed but it does not fully state all its possible uses. There are four basic types of usefulness which the editors hope the Syntopicon will have. Two of these have already been mentioned. It has been pointed out that the Syntopicon is both a reference book and a book to be read. But the Syntopicon is also intended to serve as an instrument of liberal education through the aid it can give to a certain kind of study and teaching of the great books. It is not inconsistent with its primary function as a reference book that it should, in addition prove to be an instrument of research and discovery.

#### (1) *The Syntopicon as a reference book.*

The description (in Section II of this Preface) of the parts of the Syntopicon and their function in the structure of the whole includes some indication of how it may be used as a reference book. Here we are concerned with its general character as a reference work as evidenced by the types of questions it has been constructed to answer.

In contradistinction to books of other sorts reference books are designed to help the reader who comes to them with inquiries on particular subjects. If in addition to answering the questions he brings they raise further questions in his mind and excite him to further inquiries, which in turn they are able to satisfy, they are more than answer books. They are pedagogues leading the mind from question to question in the pursuit of learning. Reference books at their best perform an educational function not simply by answering questions but by arousing and sustaining inquiry.

Nevertheless, the field of any reference book is defined in the first instance by the types of questions it is able to answer. The specific type of inquiry which the Syntopicon is able to satisfy and which gives it its special character as a reference book can be formulated by the question *What*

*do the great books have to say on this subject?* This is not the only question the Syntopicon is designed to answer, but it is the primary one.

The topics are the units through which the Syntopicon functions as a reference book, since it is under the topics that the references to the great books are assembled, and it is through reading the works or passages recommended by these references that the person who consults the Syntopicon finds the answer to his question, *What do the great books have to say on this subject?*

The range and variety of the particular subjects of inquiry on which the Syntopicon can be consulted, is indicated *quantitatively* by the number of topics and terms—2987 topics are covered in the 102 chapters, 1798 terms are listed in the Inventory of Terms. *Qualitatively*, the range and variety of the inquiries the Syntopicon is able to satisfy, can be seen only through an examination of the topics, chapter by chapter, or by an examination of the chapter titles in the Table of Contents and the words or phrases listed in the Inventory of Terms.

To every question expressed in this way—*What do the great books have to say on this subject?*—the Syntopicon helps the reader to discover the answer *for himself* by a syntopical reading of the great books in the light of the topics and guided by the references assembled under them. This fact distinguishes the Syntopicon from all other familiar reference books, which contain *within themselves* the answers to the questions on which they are consulted. The Syntopicon does not contain the answers, but only a guide to where the answers can be found in the pages of the great books. The references which constitute this guide do not tell the reader *what* the great books have to say on a particular subject. They only tell him *where* to read in the great books in order to discover for himself the thought and opinion, the imagination and emotion, in which the authors of these books have expressed their minds on this or that particular subject. For this reason it was said earlier in this Preface that only when it is taken together with the great books themselves does the Syntopicon create a reference library in the sphere of thought and opinion.

While this is true for the primary type of question which the Syntopicon is designed to answer through its system of references to the great books, it is not true, at least not to the same extent, for the subordinate types of questions now to be considered.

The question *What themes has been discussed in the tradition of a great idea?* is answered in the first instance by the Outline of Topics in the chapter on each of the great ideas. If the reader becomes interested in the actual content of the discussion under one or more of these topics, he will then be asking the primary sort of question to which the references, assembled under these topics, provide the beginning of an answer and the great books the fullness of it.

The question *To which of other great ideas is this idea related and how is it related?* is answered by the Cross-References in the chapter on each of the great ideas. The Cross-References enumerate the topics in other chapters which are related to the topics covered by the idea in question. The introductory essay on the idea also usually contains references to other introductions in which related ideas are considered. By reading the Introduction and examining the Cross-References, a person can use the Syntopicon to discover at least initially the connections between one great idea and others.

The question *What books other than those published in this set contain important discussions of this idea?* is answered to some extent by the Additional Readings listed in the chapter on each of the great ideas.

The question *What is the history of the idea, its various meanings and the problems or controversies it has raised?* is answered at least initially by the Introduction to the chapter on each of the great ideas. Here as before if the reader's interest is aroused to further inquiry the topics, the references under them the passages in the great books referred to, and the books listed in the Additional Readings provide the means for a fuller exploration of the idea, in varying degrees of thoroughness and ramification.

### (-) *The Syntopicon as a book to be read*

With respect to its ten essays on the great ideas, the Syntopicon is first of all a book to be read. These essays are arranged in the alphabetical order of the ideas, but they need not be read in that order. Each is intended to be intelligible in itself independently of the others.

The reader can therefore begin according to his interests with any one of the introductions to the great ideas. No matter where he begins, he will find that the reading of no other introduction is presupposed. But he will also find that each introduction traces some of the connections between the particular idea which it treats and other great ideas.

With whatever idea he begins the introductory essay will at least suggest other ideas as subjects of related interest. These in turn will turn his attention to, and may arouse his interest in, still others. Since each of the great ideas is directly or remotely related to many others—perhaps to all—through a network of connections radiating from each idea as a point of origin, the reader, starting at any point in the realm of thought, can explore the whole of it by going from any one idea to all the rest by circuits or pathways of his own choosing.

The reading of one or more Introductions should also turn attention to the Outlines of Topics in these same chapters, and, through them and the references organized under them, to the great books themselves. As integral parts of the Syntopicon, the Introductions to the great ideas are not intended to satisfy the reader's interest, but rather to rouse it, and then direct it to the great books. The name *Introduction* specifies the function these essays were designed to perform. When they function effectively as introductions to the Outlines of Topics and the References, they implement the use of the Syntopicon, not simply as a reference book, but as an instrument of liberal education.

### (3) *The Syntopicon as an instrument of liberal education*

The Syntopicon serves the end of liberal education to the extent that it facilitates the reading of the great books and, beyond that, the study and teaching of them. To make the nature of this educational contribution clear, it is necessary to distinguish between the *integral* and the *syntopical* reading of great books.

Integral reading consists simply in reading a whole book through. But syntopical reading does not consist simply in reading parts of a book rather than the whole. It involves the reading of one book in relation to others, all of them relevant to the consideration of the same topic.

In some cases, as the References show, whole works are cited along with passages from other works, which may be as short as a paragraph or as long as a chapter or a series of chapters. For the most part, a syntopical reading consists in reading passages of varying length rather than whole works, but the point remains that the essence of syntopical reading lies in the juxtaposition of many authors under the same topic and in consequence, the *reading together* of their works, in whole or part.

Neither of these two types of reading can ever be a substitute for the other nor can either be taken as sufficient in itself. On the contrary each is incomplete without the other. Those who begin by reading in the great books and reading them syntopically must eventually read at least some of them integrally. Those who have already read some of the great books through must read them syntopically to discover what an integral reading of the great books seldom reveals, except perhaps, to the most mature student or conscientious scholar. For each of these two sorts of persons—the beginning reader and the more advanced student or scholar—the Syn topicon functions differently, and the syntopical reading of the great books serves a different purpose.

FOR THE BEGINNING READER—in the extreme case, a person who has read none of the great books—a syntopical reading done in accordance with the references under even a few topics, works in three ways: intuitively, suggestively, and instructively.

It works intuitively by overcoming the initial difficulty that anyone faces when confronted by a collection of books as vast and, in a sense, as overpowering as Great Books of the Western World. The problem is where to begin and in what order to proceed. There are many solutions to this problem usually in the form of courses of reading based on different principles of selection but these usually require the reading of whole books or at least the integral reading of large parts of them.

It is a matter of general experience that this kind of solution seldom achieves the intended result. A syntopical reading of the great books provides a radically different sort of solution which promises to be more effective. It initiates the reading of the great books by enabling persons to read in them on the subjects in which they are interested and on those subjects, to read relatively short passages from a large number of authors. It assumes only that every educable mind has some interest in one or more of the themes, problems, or ideas on which the great books touch.

A syntopical reading may also work suggestively. Starting from a reader's existing interest in a particular topic it may arouse or create an interest in other topics related to those which initiated his reading in the great books. The syntopical reading of a collection of authors under a particular topic may also impel the reader to look beyond the passages cited. Except

when they cite whole works, the references cite passages which necessarily exist in a context ultimately the context of the whole book. Few of these passages are absolutely self-contained. For few of them can it be said that it will be finally satisfactory to read them without looking further into the author's thought. Hence, proceeding along the natural lines of his own interests, the reader may be led from reading small parts of certain books to reading larger parts and, eventually, to reading whole books. If this process is repeated, each syntopical reading may occasion and stimulate a more and more extensive integral reading of the great books.

Working intuitively and suggestively, syntopical reading opens the great books at the pages of maximum interest to the individual and, by the force of the *passages read and their dependence on context*, carries him from reading parts to reading whole works. Syntopical reading works *structively* when it guides the mind in interpreting and understanding the passages or works being read. It does this in three ways:

*First*, the topic in connection with which the passage is being read serves to give direction to the reader in interpreting the passage. But it does not tell him what the passage means since the passage cited may be relevant to the topic in any one of a number of ways. Hence the reader is called upon to discover precisely what relevance the passage has to the topic. To learn to do this is to acquire a major skill in the art of reading.

*Second*, the collection of a number of passages on the same topic, but from different works and different authors, serves to sharpen the reader's interpretation of each passage read. Sometimes when passages from the same book or author are read in sequence and in the context of one another, each becomes clearer. Sometimes the meaning of each of a series of contrasting or conflicting passages from different books or authors is accentuated when they are read against one another. And sometimes the passages from one author by amplifying or commenting on the passages cited from another, materially help the reader's understanding of the second author.

*Third*, if the individual does a syntopical reading of the great books under a number of distinct topics, the fact that the same passage will often be found cited under two or more topics will have its instructive effect. As relevant to distinct topics the passage must have an amplitude of meaning which the reader will come to perceive when he interprets it somewhat differently in relation to different topics. Such multiple inter-

pretation not only is a basic exercise in the art of reading but also tends to make the mind habitually alert to the many strains of meaning which any rich or complex passage can contain.

In this description of the ways in which a syntopical reading instructs in the art of reading the great books we have emphasized only the influence of the topic under which the reading is done and the effect of reading one passage in relation to another or in relation to several distinct topics. But to assure or reinforce its instructive effect, two other factors may operate in the background of a syntopical reading. One is the whole Outline of Topics, which places a particular topic in the context of other topics under the same idea. The other is the Introduction to that idea which may help the reader to interpret the particular topic thereby increasing the effectiveness of that topic as a guide to the interpretation of the works or passages referred to under it.

IF WE TURN NOW FROM THE BEGINNING READER to the more mature student or scholar—in the extreme case, a person who has read through many, if not all, of the great books—we shall see that a syntopical reading works in a different way. It no longer need function intuitively or suggestively nor for the competent reader need it serve instructively to develop skill in the art of reading. But it does provide the occasion and the materials for a more intensive and critical reading of passages already read and it supplements the reading of whole works independently of one another by requiring an examination of these works, or passages from them in mutual relation as relevant to the same topic.

It is the general experience of highly competent readers that a great book can be read through many times without the attainment of such complete mastery that the reader knows the relevance of every passage in it to every theme it touches. On the contrary, the integral reading of a great book even when done more than once seldom reveals even a large part of its meaning. Only the most intensive scholarly study of a particular book or author ever arrives at such mastery.

Short of that reading a great book through one or more times will inevitably leave unnoticed or only partly recognized many passages of critical significance to a particular theme or problem. Only when the book is read with that particular subject in mind will these passages, hitherto unobserved be found.

The truth of this can be verified by accomplished readers of the great books if they will examine, under particular topics, passages from books they have already read or even studied to some extent. Unless their previous reading of the books was done in the light of the particular intellectual interest represented by this topic, they are likely to find some passages that they never saw before, or at least never fully recognized as having the significance they take on when read syntopically—in the light of this topic and in relation to other works and passages relevant to the same theme.

The Syntopicon can thus serve those who have already done, to a greater or less extent, an integral reading of the great books. The method of syntopical reading not only provides a different and rewarding way of reading them, but also carries the study of them to deeper and deeper levels of understanding. It overcomes the defects of the ordinary integral reading in several ways. It involves reading the great books in relation to one another rather than in isolation. It supplements the knowledge of whole works by concentration on the significance of parts. Taking each of 3000 topics as the occasion for a purposeful reading in all the great books, it makes possible the close study of each work in relation to all the problems or issues on which it bears.

There is still another way in which the method of syntopical reading can advance the study of the great books, or rather a studious use of them. Here the aim is not to study the books themselves, but to consider a problem or an issue to the solution or clarification of which they contribute.

The particular problem may involve many topics in one or more chapters. It may involve a number of great ideas and many subordinate terms. The organization of the Syntopicon enables the student of such a problem to discover the range of the terms and topics traditionally involved in its consideration. The References enable him to examine systematically, in their chronological order or in any order he wishes, the record of western thought concerning this problem, so far as it is contained in the great books. The Additional Readings supplement these materials by citing other books which bear upon the problem more or less directly.

It does not seem an exaggeration to say that a person who has done all the syntopical reading suggested by the References and the Additional Readings on a particular problem will have a fairly adequate knowledge of that problem and its proposed solutions in the development of western

thought. The Syntopicon should be able to save the person who is beginning his inquiry into a certain problem much of the preliminary labor of research and advance him rapidly to the point where he can begin to think independently about it, because he knows what thinking has been done. For the scholar already advanced in his research on a given problem, it may still be possible for the Syntopicon to serve some good purpose as a reminder or a check. It may even uncover a neglected passage or throw new light upon one by placing it in the context of other passages.

WHAT HAS JUST BEEN SAID about the studious or scholarly use of the Syntopicon suggests how it may serve as an instrument in teaching the great books or in using them as teaching materials. For the most part, the great books enter the curricula of schools and colleges engaged in liberal education only by way of courses in which some of these books, or most of them are read integrally. Even when they are read in selections rather than as wholes they are, for the most part, used as materials in a general course of study, rather than as applicable to the study of particular subject matters.

Without detracting from or competing with the unquestionable value of such procedures, the Syntopicon offers another pedagogical use of the great books. The method of syntopical reading makes them available in the teaching of courses concerned with particular subject matters or in the conduct of seminars devoted to the study of particular problems. In certain cases, it may encourage the reading of the great texts in place of textbooks.

For a particular problem or subject matter whose name is either one of the great ideas or a major term in the Inventory of Terms, the Syntopicon suggests some, if not all, of the topics which deserve to be studied and some, if not all, of the works which deserve to be read in whole or part. It thus provides a set of materials organized so as to be adaptable to the method and interest of the individual teacher. For example, at one extreme the teacher can use the Syntopicon merely as a guide to supplementary reading; at the other extreme, he can use it to construct his own set of textual materials, selected from the References and the Additional Readings and organized in the framework of a sequence of topics.

#### (4) *The Syntopicon as an instrument of discovery and research*

What has already been said about the use of the *Syntopicon* by the serious student, or even the advanced scholar, in the sphere of a particular problem or subject matter, obviously covers part of the *Syntopicon's* utility as an instrument of research or discovery. But there are three special types of inquiry for the pursuit of which the *Syntopicon* seems to be especially adapted.

The first of these is the study of the history of ideas. The chapter on each of the 102 great ideas presents the record of thought in the form of references to the great books, organized under each topic. Since the references are arranged in the order in which the authors and works appear in the set of great books, and since with few exceptions, this is a strictly chronological order, the record of thought is presented in an order suited to the historian's interest. The Additional Readings, which supplement the great books in the record are also arranged chronologically. Hence the *Syntopicon* provides an organization of materials eminently useful to the scholar engaged in the historical study of ideas.

The second type of special inquiry concerns the thought of a single author, in its historical relation to the thought of predecessors who influenced him and followers influenced by him. If that author happens to be one of the authors of the great books, the *Syntopicon* can facilitate such research, since for hundreds of distinct topics it places references to the work of the particular author in the context of references to other authors—earlier, later or contemporary—whom he may have influenced or by whom he may have been influenced.

The third type of special inquiry is limited to the thought of a particular period rather than a particular author. Within this limitation the historical interest may extend to all the great and near great minds who formed the thought of this period as well as to all the ideas with which they dealt. So far as the formative minds of the particular period are represented by authors of the great books and by other authors cited in the Additional Readings, the *Syntopicon* can assist such research. Instead of using its references vertically from one end of the tradition to the other, as would the student of the history of an idea, the student of an epoch of thought would cut through the references horizontally. He would take all the authors and books which fell within the period under considera-

tion he would examine the materials referred to under every idea or topic which appeared to have been considered by the minds of that period.

In these three types of historical inquiry, the Syntopicon is at best an auxiliary instrument in the service of scholarship. If it proves to be more than that for the ordinary student it will probably be less than that for the accomplished scholar whose documentary resources in a particular field are more extensive than those from which the Syntopicon is constructed. This is especially true of those problems in the history of ideas which have been investigated by prolonged research. But some problems have not been so investigated and the Syntopicon may have something to contribute to the study of these. It is even possible that the Syntopicon may uncover or call attention to new problems, or may cause the reformation of old problems in a new way.

THE GRAND RESEARCH suggested by the existence of the Syntopicon is not historical, however but philosophical. Stated simply it is the project of creating in and for the twentieth century a synthesis or summation of western thought past and present which will serve the intellectual needs of our time as analogous syntheses or summations have served antiquity, the Middle Ages, and the period of the enlightenment.

The 10 great ideas, the 1800 other terms, and the 5000 topics of the Syntopicon are a fair representation of the objects as the materials to be found in the 443 works here published and the 2600 other works listed in the Additional Readings are a fair representation of the *center* of western inquiry and discussion. The Syntopicon is, therefore an instrument adapted to the sort of research which might produce a summation of western thought from the beginning to the present.

Because the existence of the Syntopicon makes it possible and suggests that it be undertaken the project envisaged might be called a Program of Syntopical Research. Because the method of this research like the method which produced the Syntopicon would be thoroughly dialectical in character the intellectual summation which would be its product could be called a Summa Dialectica.

# EXPLANATION OF REFERENCE STYLE

THE references have a uniform typographical style but the manner of referring to particular works varies in certain respects. The Explanation of Reference Style describes the typographical construction of the references, with some comment on the variations. It is divided into four parts:

## I General Typographical Style

## II Style of Bible References

## III Punctuation Symbols Abbreviations

## IV Table of Authors, Titles, and Author's Divisions Cited

## I GENERAL TYPOGRAPHICAL STYLE

The two examples below illustrate the general typographical pattern of the references to *Great Books of the Western World* and the headings above the examples call attention to the five elements commonly present in the construction of the references.

Volume	Author's Name	Title of Work	Author's Divisions	Page Sections
35	Locke	<i>Human Understanding</i>	bk. II ch. xxii	178a 200d
41	Gibbon	<i>Decline and Fall</i>		365b 378d

### (1) Volume Number

The volume number indicates in which volume of *Great Books of the Western World* the work or passage referred to can be found. Most volumes contain the work of one author. When a single volume contains the works of two or more authors, the volume number is given for each author. When the work of a single author is contained in two volumes, the volume number is assigned according to the contents of the volume.

### (2) Author's Name

The author's name immediately follows the volume number except in the case of the American State Papers and the Federalist which are included in Volume 43. Authors' names are usually given in shortened form.

### (3) Title of Work

The title follows the author's name, with the two exceptions above noted. Titles are also frequently abbreviated or shortened. When two or more works are cited for a single author, the titles are listed in the order in which the works appear in the volume.

### (4) Author's Divisions

By "author's divisions" is meant all such subdivisions of a work as book, part, section, chapter, paragraph, line number. The phrase "author's divisions" does not necessarily mean divisions made by the author, they may have been made by an editor of his work.

Author's divisions are given only for some works, according as, in the judgment of the editors, their inclusion would prove meaningful or helpful to the reader. References to Locke, for instance, as in the example, always cite author's divisions, whereas references to Gibbon, as in the example, do not.

For some works, author's divisions are completely given, as for Locke. For other works, only the most important or largest divisions are given. Thus for Rabelais only the book but not the chapter is given.

Line numbers in brackets, are given for all works of poetry, including those published in prose translations. For Goethe's *Faust*, the line numbers cited refer to the lines of the English translation as well as to the lines of the original German. For other poetical works in translation—the works of Homer, the Greek dramatists Lucretius, Virgil, and Dante—the line numbers cited refer to the lines of the works in their original languages, for these works, the line numbers printed on the pages of this edition furnish only an approximate indication of the location of the equivalent lines in the English translation. For all poetical works written in English, the line numbers are the numbers of the English lines. In the case of Chaucer's *Canterbury Tales*, the numbering of the lines is consecutive for all the tales written in verse.

In references to the works of Aristotle (in Volumes 8 and 9), the figures and letters enclosed in the brackets signify the page column, and approximate line in the Berlin edition of the Greek text edited by Immanuel Bekker. In references to the American State Papers (in Volume 43),

the bracketed line numbers refer to the lines on the pages of this edition only.

In references to the *Summa Theologica* of Thomas Aquinas (in Volumes 19 and 20) the author's division "Part I-II" stands for Part I of the Second Part, and "Part II-II" stands for Part II of the Second Part. In the case of the *Summa Theologica* the author's divisions cited may include not only questions and articles, but the subdivisions of articles. In such cases the page sections correspond in extent to that of a whole article, to enable the reader to see the subdivision of an article, when it is cited in the context of other parts to which it is related.

Author's divisions precede page sections except in the case of footnote and note numbers, which follow page sections. When more than one passage is cited within the same author's division, the author's division is not repeated as, for example:

33 Rousseau *Social Contract* II 403a-404a 405d-406a

### (5) Page Sections

The pages of *Great Books of the West in World* are printed either on or two columns. The upper and lower halves of a one-column page are indicated by the letters a and b. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand column, the letters c and d to the upper and lower halves of the right hand column. These half and quarter page sections are based on divisions of a full text page.

Page sections give the page numbers and locate the sections of the page in which the passage referred to begins and ends. For example, in the reference

53 Kant *Psychology* 116a 119b

the passage cited begins in the upper half of page 116 and ends in the lower half of page 119. In the reference

7 PLATO *Symposium* 163b-164c

the passage cited begins in the lower half of the left hand column of page 163 and ends in the upper half of the right hand column of page 164.

In references to works printed in two columns, the form of the page

### (3) Title of Work

The title follows the author's name, with the two exceptions above noted. Titles are also frequently abbreviated or shortened. When two or more works are cited for a single author, the titles are listed in the order in which the works appear in the volume.

### (4) Author's Divisions

By "author's divisions" is meant all such subdivisions of a work as book, part, section, chapter, paragraph, line number. The phrase "author's divisions" does not necessarily mean divisions made by the author, they may have been made by an editor of his work.

Author's divisions are given only for some works, according as, in the judgment of the editors their inclusion would prove meaningful or helpful to the reader. References to Locke, for instance, as in the example, always cite author's divisions, whereas references to Gibbon, as in the example do not.

For some works author's divisions are completely given, as for Locke. For other works, only the most important or largest divisions are given. Thus for Rabelais only the book but not the chapter is given.

Line numbers, in brackets, are given for all works of poetry, including those published in prose translations. For Goethe's *Faust* the line numbers cited refer to the lines of the English translation as well as to the lines of the original German. For other poetical works in translation—the works of Homer, the Greek dramatists Lucretius, Virgil and Dante—the line numbers cited refer to the lines of the works in their original languages, for these works, the line numbers printed on the pages of this edition furnish only an approximate indication of the location of the equivalent lines in the English translation. For all poetical works written in English the line numbers are the numbers of the English lines. In the case of Chaucer's *Canterbury Tales*, the numbering of the lines is consecutive for all the tales written in verse.

In references to the works of Aristotle (in Volumes 8 and 9) the figures and letters enclosed in the brackets signify the page, column and approximate line in the Berlin edition of the Greek text edited by Immanuel Bekker. In references to the American State Papers (in Volume 43),

### III PUNCTUATION SYMBOLS ABBREVIATIONS

#### (i) Punctuation

*Diagonal line* When a series of references to one author includes two or more of his works published in the same volume a diagonal line is used to separate references to one work from references to another. The diagonal line is used in the same way to separate references to different books of the Bible. For example

OLD TESTAMENT Exodus 33:1-23 / Job 11:7-9

43 Mill Liberty 302d 303a / Representative Government 327b d 332d

*Semi Colon* When a series of references includes the citation of two or more passages in the same work a semi-colon is used to separate the references to these passages. For example

OLD TESTAMENT Genesis 11:1-14; 9:1-11

38 POISSON Social Contract BK II 403a-404a 405d-406a

46 HEGEL Philosophy of History PART II 265c 266a PART IV 346c 348a

*Comma* When a comma separates the title of a work or an author's division of a work from the page sections which follow, passages cited are only a part of the whole work or of the author's division indicated. For example, in the references

14 PLUTARCH Lycanus 36a b 44d 45

36 SWIFT Gulliver's Travels PART II 73a 4b

the passages from Plutarch are only a part of *Lycanus* and the passage from Swift is only a few pages from Part II of *Gulliver's Travels*

When the title of a work or an author's division of a work, is not separated by a comma from the page sections which follow the reference is to the whole work or to the whole of the indicated author's division. For example, in the references

14 PLUTARCH Lycanus 32a-48d

36 SWIFT Gulliver's Travels PART II 45a 87b

the whole of *Lycanus* and the whole of Part II of *Gulliver's Travels* are cited

sometimes places continuous reading matter in the a and c sections of the upper half of the page, or in the b and d sections of the lower half of the page. This occurs when a work or an author's division begins in the lower, or ends in the upper, half of the two column page. Where continuous reading matter thus appears in discontinuous page sections, it is indicated by a,c or b,d. For example

14 PLUTARCH *Solon* 64b d 77a c

means that the work cited begins in the lower half of page 64 and ends in the upper half of page 77.

Footnotes or notes are sometimes specifically cited by themselves in the references, in which case the page sections given correspond to their location on the pages referred to. When a footnote or a note is not specifically cited, the page sections given mark the beginning and the end of the text referred to. The reader is expected to consult the footnotes or notes indicated in the body of that text.

Chaucer's works (in Volume 22) are printed in two columns, the inside column of each page contains the Middle English text, the outside column a Modern English version. Since both columns contain equivalent passages, the references to this volume employ page sections (a and b) which divide each page only into an upper and a lower half.

## II STYLE OF BIBLE REFERENCES

All Bible references are to book, chapter, and verse in both the King James and Douay versions of the Bible. When the King James and Douay versions differ in the title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows. For example

OLD TESTAMENT *Nehemiah* 7 42—(D) *II Esdras* 7 46

In references to the Bible a colon is used to separate chapter and verse numbers, and a comma separates the numbers of verses in the same chapter. For example

OLD TESTAMENT *Exodus* 6 1-4 16-18

## IV TABLE OF AUTHORS TITLES AND AUTHORS DIVISIONS CITED

The following pages present a tabulation of the contents of *Great Books of the Western World* Volumes 4-54. The authors are enumerated in the order in which they appear in the successive volumes of the set, and under each author's name the titles of his works are listed in the order of their appearance.

In the references, the name of the author is frequently given in shortened form. In this table, their full names are given followed by their life dates when these are ascertainable. Because some volumes contain the works of two or more authors who may be separated by centuries, the order in which the authors are cited in the references sometimes departs from the strict chronological order. The life dates help the reader to place the authors and their works in the right chronological order.

In the references, the title of a work is frequently given in an abbreviated or shortened form. In this table, the titles are first given exactly as they appear in the references. Whenever this is an abbreviated or shortened title, the full title follows.

The table also includes a notation of the author's divisions that are used in references to particular works.

A dash in the column headed "Author's Divisions Cited" means that references to the work or works in question cite no sections or parts. Where the author divisions cited are the same for several titles, they are named only once either opposite the set of titles as a whole or opposite the last title in the group.

Fractions in brackets are new titles which appear as a part of the work, but do not bear in the references. The names of the authors of *The Peasant* (in Volume 43) are bracketed because they do not appear in the references.

### Volume Number Author and Title

4 Virgil

*The Iliad*

- 5 *Aeneid* (pp. 525-456 c.)
- T 5 *Ecologues*
- The Aeneid*
- The Seven Against Thebes*
- Prometheus Bound*

*The Odyssey*

- Aeneas*
- Choerilus*
- Euripides*

Author's Divisions Cited

BOOK, Line

Lane

### (2) Symbols

*esp* The abbreviation esp precedes one or more especially relevant passages which are contained within the page boundaries of a larger passage or a whole work that has just been cited

Whenever passages contained within a single reference are especially referred to, a comma after the page sections separates these passages For example

42 KANT *Science of Right* 435a 441d esp 435c 436b 437c d 438d 441d

Whenever passages contained within a single reference to the Bible are especially referred to, a comma is also used to separate these passages For example

NEW TESTAMENT *Romans* 1-8 esp 2 11-16 2 27-29 7 21-25 8 27

*passim* The word *passim* following a reference signifies that the work or passage referred to discusses the topic under which it is cited, intermittently rather than continuously For example

9 ARISTOTLE *Politics* BK II CH 7 461d 463c *passim* / *Ithenean Constitution* CH I-41 553a 572d *passim*

### (3) Abbreviations

The following is a list of the abbreviations used in the references Unless an abbreviation for the plural is listed below, the singular abbreviation is used for both singular and plural words

THE GREAT IDEAS I  
*Chapters 1-50 ANGEL to LOVE*

# *Chapter I ANGEL*

## *INTRODUCTION*

INFLUENCED by a long tradition of religious symbolism in painting and poetry, our imagination responds to the word "angel" by picturing a winged figure robed in dazzling white and having the bodily aspect of a human being.

This usage common to believers and unbelievers, contains features which represent some of the elements of meaning in the abstract conception of angels as this is found in the writings of Jewish and Christian theologians and in related discussions by the philosophers. The human appearance suggests that angels, like men, are persons that they are most essentially characterized by their intelligence. The wings suggest the function of angels—their service as messengers from God to man. The aura of light which surrounds them signifies, according to established conventions of symbolism, the spirituality of angels. It suggests that to imagine angels with bodies is to use a pictorial metaphor.

Another interpretation might be put upon this idea of being if one considers the role which the notion of angel has played in the history of thought. Wherever that notion has entered in to discussions of God and man, of matter and mind and soul of knowledge and love and even of time space and motion, it has cast light upon these other topics. The illumination which has been and can be derived from the idea of angels as a special kind of being or nature is in no way affected by doubts or denials of the existence.

Whether such beings exist or not, the fact that they are conceivable has significance for theory and analysis. Those who do not believe in the existence—or even the possible existence—of utopian nevertheless regard them as factors useful analytically in appraising accepted realities. What an ideal society would be can be considered apart from the quest on

of its existence and so considered it functions as an hypothesis in political and economic thought. What sort of being an angel would be if one existed can likewise serve as an hypothesis in the examination of a wide variety of theoretical problems.

The idea of angels does in fact serve precisely this way as an analytical tool. It sharpens our understanding of what man is how his mind operates, what the soul is, what manner of existence and action anything would have apart from matter. Hence it suggests how matter and its motions in time and space determine the characteristics of corporeal existence. Pascal's remark—that "man is neither angel nor brute and the unfortunate thing is that he who would act the angel acts the brute"—points to the different conceptions of man which result from supposing him to be either angel or brute rather than neither. Such views of human nature considered in the chapters on *ANIMAL* and *MAN* cannot be fully explored without reference to theories of the human mind or soul in its relation to matter and to body. As the chapters on *MEN* and *SOCIAL* indicate, the ones carrying the names of Plato and Descartes, which attribute to the human mind or soul the being, and powers of a purely spiritual substance or entity seem to place man in the company of the angels. In this tradition Locke applies the word "spirits" equally to human minds and to supra-human intelligences.

It would be misleading to suppose that the idea of angels is primarily a construction of the philosophers—a fiction invented for their analytical purposes or that it is simply their conception of a supra mundan reality concerning the existence and nature of which they dispute. In the literature of western civilization angels first appear by name or reference in the Old

and the New Testaments Readers of the Bible will remember many scenes in which an angel of the Lord performs the mission of acquainting man with God's will. Among the most memorable of such occasions are the visits of the angels to Abraham and Lot and the angelic ministry of Gabriel in the Annunciation to Mary.

In one book of the Bible *Tobias* (Tobit as it is called in the King James Apocrypha) one of the leading characters is the angel Raphael. Through most of the story he appears as a man but at the end after he has accomplished his mission he reveals his identity. I am the angel Raphael he declares.

one of the seven who stand before the Lord

And when they had heard these things they were troubled and being seized with fear they fell upon the ground on their face.

And the angel said to them Peace be to you Fear not

For when I was with you I was there by the will of God bless ye him and sing praises to him

I seemed to eat and to drink with you but I use an invisible meat and drink which cannot be seen by men

It is time therefore that I return to him that sent me

And when he had said these things he was taken from their sight and they could see him no more

As a result of scriptural exegesis and commentary the angels become a fundamental topic for Jewish theologians from Philo to Maimonides and for such Christian theologians as Augustine Scotus Eriugena Gregory the Great Aquinas Luther Calvin Pascal and Schleiermacher. They figure in the great poetry of the Judeo-Christian tradition—in the *Dante* *Comedy* of Dante in *Paradise Lost* of Milton and in Chaucer's *Canterbury Tales* and Goethe's *Faust*.

The philosophers especially in the 17th and 18th centuries are motivated by Scripture or provoked by theology to consider the existence the nature and the activity of angels. Hobbes for example attacks the supposition that angels are immaterial on the ground that the notion of incorporeal substance is self contradictory and undertake to re interpret all the scriptural passages in which angels are described as spirits. After examining a great many he says that to mention all the places of the Old Testament where the name of Angel is found would be too long. Therefore to comprehend them all at once I say there is no text in that part of the

Old Testament which the Church of England holdeth for Canonical from which we can conclude there is or hath been created any permanent thing (understood by the name of Spirit or Angel) that hath not quantity and in sum which is not (triling Body for that which is somewhat or somewhere) Corporeal.

All the passages can be interpreted Hobbes thinks simply in the sense in which angel means messenger and most often a messenger of God which signifies anything that makes known his extra ordinary presence. If instead of existing only when they carry God's word to men the angels are supposed to have permanent being then they must be corporeal. As in the resurrection men shall be permanent and not incorporeal Hobbes writes so therefore also are the angels. To men that understand the signification of these words *sub tunc* and *incorporeal*—and mean by incorporeal having no body at all not just a subtle body—the words taken together imply a contradiction. Hence Hobbes argues that to say an angel or spirit is (in that sense) an incorporeal substance is to say in effect that there is no angel or spirit at all. Considering therefore the signification of the word angel in the Old Testament and the nature of dreams and visions that happen to men by the ordinary way of nature Hobbes concludes that the angels are not in fact but supernatural apparitions of the fancy raised by the special and extraordinary operation of God thereby to make his presence and commands known to mankind and chiefly to his own people.

Locke seems to take the exactly opposite position. Asserting that we have no clear or distinct idea of substance in general he does not think spirits any less intelligible than bodies.

The idea of corporeal substance he writes is as remote from our conceptions and apprehensions as that of spiritual substance or spirit and therefore from our not having any notion of the substance of spirit we can no more conclude its non existence than we can for the same reason deny the existence of body. Just as we form the complex idea of bodies by supposing their qualities such as figure and motion or color and weight to coexist in some substratum so by supposing the activities we find in ourselves—such as thinking understanding

willing knowing and the power of beginning motion etc — to co-exist in some substance we are able to frame the complex idea of an immaterial spirit

(the bestower and creator of forms) and perhaps for angels or intelligences at once to recognize forms affirmatively at the first glance of contemplation.

Not only does Locke think that we have as clear a perception and notion of immaterial substances as we have of material but he also finds the traditional doctrine of a hierarchy of angels quite acceptable to reason. It is not impossible to conceive nor repugnant to reason that there may be many species of spirits as much separated and diversified one from another by distinct properties whereof we have no ideas as the species of sensible things are distinguished one from another by qualities which we know and observe in them.

Locke goes even further—beyond the mere possibility of angels to the likelihood of their real existence. His reasoning resembles the traditional argument of the theologians on this difficult point. When we consider the infinite power and wisdom of the Maker he writes

we have reason to think that it is suitable to the magnificent harmony of the Universe and the great design and infinite goodness of the Architect that the species of creatures should also by gentle degree ascend upward from us to his infinite perfection as we see they gradually descend from us downwards.

Such speculations concern the existence and the order of angels, a usually thought to be the province of the theologian rather than the philosopher. But Bacon like Locke does not think it unfitting for the philosopher to inquire into such matters. In natural theology—for him a part of philosophy—Bacon thinks it is improper from the contemplation of nature and the principles of human reason to dispute or urge anything with vehemence as to the mysteries of faith. But it is otherwise he declares, as to the nature of spirits and angels this being neither unsearchable nor forbidding in a great part level to the human mind on account of their affinity.

He does not further instruct us concerning a test in the *Aramaic* of *Learn* g but in the *Vision* Orgasm he it too shall hit on their nature as well as ours by touching on one that a trifling difference between the human and the angelic mind. Discussing therefore the theory of induction he holds that it is only for God

UNLIKE most of the great ideas with which we are concerned the idea of angel seems to be limited in its historical scope. It is not merely that since the 18th century the discussion has dwindled but also that the idea makes no appearance in the great books of pagan antiquity—certainly not in the strict sense of the term whereby angel signifies a creature of God spiritual in substance and nature and playing a role in the divine government of the universe.

There are nevertheless analogous conceptions in the religion and philosophy of the ancients and in philosophy at least the points of resemblance between the analogous concepts are sufficiently strong to establish a continuity of discussion. Furthermore elements in the thought of Iatrus Aristotle and Plotinus exercise a critical influence on Judaeo-Christian apologetics.

Gibbon relates how the early Christians made the connection between the gods of polytheism and their doctrine about angels. It was the universal sentiment both of the church and of heretics, he writes, that the daemons were the authors the patrons and the objects of idolatry. Those rebellious spirits who had been degraded from the rank of angels and cast down into the infernal pit were still permitted to roam upon the earth to torment the bodies and to seduce the minds of sinful men. The daemons soon discovered and abused the natural propensity of the human heart towards devotion and artfully withdrawing the adoration of mankind from their Creator they usurped the place and honors of the Supreme Deity.

In the polytheistic religions of antiquity the demi gods or inferior deities are beings superior in nature and power to man. The polytheist and the philosopher the Greek and the barbarian writes Gibbon were alike accustomed to conceive a long succession an infinite chain of angels or daemons or deities, or aeons or emanations, rising from the throne of light. In Plato's *Symposium* for example Diotima tells Socrates that Love is intermediate be-

tween the divine and the mortal and interprets between gods and men conveying and taking across to the gods the prayers and sacrifices of men and to men the commands and replies of the gods he is the mediator who spans the chasm which divides them. Love Diotima explains is only one of these spirits and intermediate powers which are many and diverse.

Such demi-gods are intermediate by their very nature. Although superhuman in knowledge and action they still are not completely divine. Occupying a place between men and gods they are according to Plato by nature neither mortal nor immortal. Their existence is necessary to fill out the hierarchy of natures. They are links in what has come to be called the great chain of being.

The analogy with the angels arises primarily from this fact of hierarchy. Both pagan and Christian religions believe in an order of supernatural or at least superhuman beings graded in perfection and power. In both these beings serve as messengers from the gods to men, they act sometimes as guardians or protectors, sometimes as tricksters, deceivers and enemies of man. But the analogy cannot be carried much further than this. The angels according to Christian teaching are not inferior gods or even demi-gods. As compared with the intermediate spirits of pagan religion they are less human in character as well as less divine. Nevertheless the reader of the great poems of antiquity will find a striking parallelism between the heavenly insurrection which underlies the action of *Prometheus Bound* and the angelic warfare in *Paradise Lost*.

**IN THE WRITINGS** of Plato Aristotle and Plotinus philosophical inquiry turns from the sensible world of material things to consider the existence and nature of an order of purely intelligible beings. Is there an inherent connection between being perceptible to the sense and being material so that which is purely intelligible must be completely immaterial? If ideas exist independently—in their own right and apart from knowing or thinking minds—then they constitute such an order of purely intelligible entities.

At this point a number of difficult questions arise. Are the intelligibles also intelligences, i.e.

are they an order of knowers as well as a realm of knowables? Can they be regarded as substances? And if so do they have a mode of action appropriate to their mode of being—action which is other than knowing action which in some way impinges on the course of events or the motions of the physical world?

Plotinus answers affirmatively that the purely intelligible beings are also pure intelligences but he does not conceive them as having any power or action except that of knowledge. An other answer to these questions given in antiquity and the Middle Ages is that the intelligences are the celestial motors the movers of the heavenly bodies. Since we see Aristotle write that besides the simple spatial movement of the universe which we say that the first and unmovable substance produces there are other spatial movements—those of the planets—which are eternal (for a body which moves in a circle moves eternally) each of these movements also must be caused by a substance both unmovable in itself and eternal. These secondary movers Aristotle thinks are of the same number as the movements of the stars and not only must they be eternal and unmovable as is the prime mover but also without magnitude or immaterial.

Plato offers an alternative hypothesis—that the celestial bodies are alive and have souls. This hypothesis like Aristotle's tends in the Middle Ages to be restated in terms of the theory of angels. Aquinas reports Augustine as thinking that if the heavenly bodies are really living beings their souls must be akin to the angelic nature. He himself holds that spirit and substances are united to them as movers to things moved—the proof of which he says lies in the fact that whereas nature moves to one fixed end in which having attained it it rests this does not appear in the movement of the heavenly bodies. Hence it follows that they are moved by some intellectual substances.

The question whether intelligences govern the planets also occupies the attention of an astronomer like Kepler. Although he denies any need for such intelligences—among other reasons because planetary motion is not circular but elliptical—he argues that the celestial movements are the work either of the natural power of the bodies or else a work of the soul.

acter uniformly in accordance with those bodily powers." But whether or not they are to be regarded as movers as well as knowers and know other intelligences represent for ancient and mediaeval thought a modus of being, exempt from the vicissitudes of physical change even as it is separate from matter.

When modern philosophers consider spirits or spiritual beings they seldom deal with the ancient speculations about pure intelligibles or separate intelligences without being influenced by the theological doctrine of angels which developed in mediaeval thought.

The extent of this doctrine may be judged from the fact that the *Summa Theologica* of Aquinas contains a whole treatise on the angels, as well as additional questions on the speech of angels, their hierarchies and orders, the division between the good and the bad angels, and their action on men—the guardianship of the good angels and the assaults of the demons. That these additional questions are contained in the treatise on divine government throws some light on their doctrinal significance.

The primary fact about the angelic nature is immateriality. An angel is immaterial both in his substantial being and in his characteristic act by which, says Aquinas, is an altogether immaterial mode of operation. Being immaterial, they are also incorruptible. "Nothing is corrupted except by its form being separated from the matter." Consequently, Aquinas writes "a substance composed of matter and form ceases to be actual when the form is separated from the matter. But if the form subsists in its own being as happens in the angels, it cannot lose its being." To justify that the separate intelligences existing apart from matter the angel is a substance called "substantia forms" and sometimes separate substances.

Although they are unigenitally in being and immaterial, the angels are not like God in that they are "not in the beginning, nor in the end, nor in the middle." That notion of becoming which Thou art in the beginning is worse than mortal nature." Augustine writes, but it is in no way coextensive with Thee. As created things have a beginning. Yet whilst not eternal, nor free from temporal creatures in continual flux, but according to Augustine they "partake of Thy eternity through the

surety of that most happy contemplation of Thyself dwelling close unto Thee placed beyond all the rolling vicissitudes of time. It is for this reason that the angels are spoken of as eternal.

The familiar question concerns the number of angels able to stand on a needle's point—if it was ever asked by mediaeval theologians—merely poses the problem of how an incorporeal substance occupies space. The way in which Aquinas discusses angels in relation to place discloses how the question gives rise to generally significant issues concerning the nature of space and quantity and their relation to causality. He points out that a body occupies a place in a circumscribed fashion i.e., its dimensionality is contained within the space whereas "an angel is said to be in a corporeal place by application of the angelic power in any manner whatever to the place." An incorporeal substance virtually contains the thing with which it comes into contact and is not contained by it. To an objector who thinks that since unlike bodies angels do not fill a place several can be in the same place at the same time Aquinas replies that two angels cannot be in the same place because "it is impossible for two complete causes to be immediately the cause of one and the same thing." Since an angel is where he acts, and since by the power of his action he contains the place at which he acts "there can not be but one angel at one place."

Angels are also said to go from one place to another without traversing the intervening space and without the lapse of time. Considering their immateriality such action is less remarkable for angels to perform than is the action of electrons, which according to modern quantum mechanics jump from outer to inner orbits of the atom without taking time or passing through inter-orbital space.

The immateriality of angels has other consequences which throw considerable light on the conception of corporeal existence. In the world of physical things we ordinarily think of a species as including a number of individual units. While all men have the same specific nature they differ numerically or individually. But the angels are immaterial substances. It is held that each angel is a distinct species. Those which are species but differ in

tween the divine and the mortal and interprets between gods and men conveying and taking across to the gods the prayers and sacrifices of men and to men the commands and replies of the gods he is the mediator who spans the chasm which divides them' Love Diotima explains is only one of these spirits and intermediate powers which are many and diverse

Such demi gods are intermediate by their very nature Although superhuman in knowledge and action they still are not completely divine Occupying a place between men and gods they are according to Plato by nature neither mortal nor immortal Their existence is necessary to fill out the hierarchy of natures They are links in what has come to be called the great chain of being

The analogy with the angels arises primarily from this fact of hierarchy Both pagan and Christian religions believe in an order of supernatural or at least superhuman beings graded in perfection and power In both these beings serve as messengers from the gods to men they act sometimes as guardians or protectors sometimes as traducers deceivers and enemies of man But the analogy cannot be carried much further than this The angels according to Christian teaching are not inferior gods or even demi gods As compared with the intermediate spirits of pagan religion they are less human in character as well as less divine Nevertheless the reader of the great poems of antiquity will find a striking parallelism between the heavenly insurrection which underlies the action of *Prometheus Bound* and the angelic warfare in *Paradise Lost*

IN THE WRITINGS of Plato Aristotle and Plotinus philosophical inquiry turns from the sensible world of material things to consider the existence and nature of an order of purely intelligible beings As there is an inherent connection between being perceptible to the senses and being material so that which is purely intelligible must be completely immaterial If ideas exist independently—in their own right and apart from knowing or thinking minds—then they constitute such an order of purely intelligible entities

At this point a number of difficult questions arise Are the intelligibles also intelligences i.e.

are they an order of knowers as well as a realm of knowables? Can they be regarded as substances? And if so do they have a mode of action appropriate to their mode of being—action which is other than knowing action which in some way impinges on the course of events or the motions of the physical world?

Plotinus answers affirmatively that the purely intelligible beings are also pure intelligences but he does not conceive them as having any power or action except that of knowledge An other answer to these questions given in antiquity and the Middle Ages is that the intelligences are the celestial motors the movers of the heavenly bodies Since we see Aristotle write that besides the simple spatial movement of the universe which we say that the first and unmovable substance produces there are other spatial movements—those of the planets—which are eternal (for a body which moves in a circle moves eternally) each of these movements also must be caused by a substance both unmovable in itself and eternal These secondary movers Aristotle thinks are of the same number as the movements of the stars and not only must they be eternal and unmovable as is the prime mover but also without magnitude or immaterial

Plato offers an alternative hypothesis—that the celestial bodies are alive and have souls This hypothesis like Aristotle's tends in the Middle Ages to be restated in terms of the theory of angels Aquinas reports Augustine as thinking that if the heavenly bodies are really living beings their souls must be akin to the angelic nature He himself holds that spiritual substances are united to them as movers to things moved the proof of which he says lies in the fact that whereas nature moves to one fixed end in which having attained it it rests this does not appear in the movement of the heavenly bodies Hence it follows that they are moved by some intellectual substances

The question whether intelligences govern the planets also occupies the attention of an astronomer like Kepler Although he denies any need for such intelligences—among other reasons because planetary motion is not circular but elliptical—he argues that the celestial movements are the work either of the natural power of the bodies or else a work of the soul

act uniformly in accordance with those bodily powers. But whether or not they are to be regarded as *material* as well as *louers and knowers* of the intelligences represent for ancient and mediaeval thou ht a mode of being exempt from the vicissitudes of phys cal change even as it is separate from matter.

WHEN MODERN philosophers consider spirits or spiritual being they seldom deal with the ancient speculations about pure intelligibles or separate intelligences without being influenced by the theological doctrine of angels which developed in mediaeval thought.

The extent of this doctrine may be judged from the fact that the *Summa Theologica* of Aquinas contains a whole treatise on the angels as well as additional questions on the speech of angels their hierarchies and orders the division between the good and the bad angels, and their action on men—the guardianship of the good angels and the assaults of the demons. That these additional questions are contained in the treatise on divine government throws some light on their theological significance.

The primary fact about the angelic nature is immateriality. An angel is immaterial both in its substantial being and in its characteristic act, i.e. which says Aquinas is an altogether immaterial mode of operation. Being immaterial they are also incorruptible. Nothing is corrupted except by its form being separated from the matter. Consequently Aquinas writes, a subject composed of matter and form ceases to be actually when the form is separated from the matter. But if the form subsists in its own being as happens in the angels, it cannot lose its being. To say that they are intelligences existing apart from matter the angels are sometimes called subsisting forms and sometimes separate substances.

Although they are imperishable in being and have immortal life the angels are not like God and eternal. Their heaven of heavens which Thou art dost not degenerate's some intellect in creature. Augustine writes, but it is in a *divine* eternal life there is created the angels at a beginning yet while not eternal neither are they temporal creatures in control but according to a time there partake of Thy eternity through the

sweetness of that most happy contemplation of Thyself cleaving close unto Thee placed beyond all the rolling vicissitudes of times. It is for this reason that the angels are spoken of as *eternal*.

The familiar question concerning the number of angels able to stand on a needle's point—if it was ever asked by mediaeval theologians—merely poses the problem of how an incorporeal substance occupies space. The way in which Aquinas discusses angels in relation to place discloses how the question serves to raise generally significant issues concerning the nature of space and quantity and their relation to causality. He points out that a body occupies place in a circumscribed fashion i.e. its dimension quantity is contained within the space which means an angel is said to be in a corporeal place by application of the angelic power in any manner whatever to the place. An incorporeal substance virtually contains the thing with which it comes into contact and is not contained by it. To an objector who thinks that since visible bodies angels do not fill a place several can be in the same place at the same time Aquinas replies that two angels cannot be in the same place because it is impossible for two complete causes to be immediately the cause of one and the same thing. Since an angel is where he acts and since by the power of his action he contains the place at which he acts there can not be but one angel at one place.

Angels are also said to go from one place to another without traversing the intervening space and without the lapse of time. Considering their immateriality such action is less remarkable for angels to perform than is the action of electrons which according to modern quantum mechanics jump from outer to inner orbits of the atom without taking time or passing through inter-orbital space.

The immateriality of angels has other consequences which throw comparative light on the conditions of corporeal existence. In the world of physical things we ordinarily think of a species as including a number of individuals. While all men have the same specific nature they differ numerically or individually. But because angels are immaterial substances it is held that each angel is a distinct species. Things which agree in species but differ in

number Aquinas explains agree in form but are distinguished materially It therefore the angels are not composed of matter and form it follows that it is impossible for two angels to be of one species

Furthermore as Aquinas states in another place among incorporeal substances there can not be diversity of number without diversity of species and inequality of nature Each species is necessarily higher or lower than an other so that the society of angels is a perfect hierarchy in which each member occupies a distinct rank No two angels are equal as on the supposition that they share in the same specific humanity all men are Yet such names as seraphim and cherubim and the distinction between archangels and angels indicate an organization of spiritual substances into various groups—according to the tradition into nine orders or subordinate hierarchies

The nine orders or ranks of angelic being are described by Dante in the *Paradiso* as distinct circles of love and light Using these metaphors he thus reports his vision of the heavenly hierarchy I saw a Point which was raying out light so keen that the sight on which it blazes must needs close because of its intense brightness Perhaps as near as a halo seems to girdle the light which paints it when the vapor that bears it is most dense at such distance around the Point a circle of fire was whirling so rapidly that it would have surpassed that motion which most swiftly girds the world and this was girt around by another and that by the third and the third then by the fourth by the fifth the fourth and then by the sixth the fifth Thereon the seventh followed so wide spread now in compass that the messenger of Juno entire would be narrow to contain it So the eighth and ninth

Beatrice explains to him how the relation of the circles to one another and to the Point which is God depends upon their measure of love and truth whereby there is in each heaven a marvellous agreement with its Intelligence of greater to more and of smaller to less She then amplifies her meaning The first circles have shown to thee the Seraphim and the Cherubim Thus swiftly they follow their own bonds in order to liken themselves to the Point as most they can and they can in proportion

as they are exalted to see Those other loves which go around them are called Thrones of the divine aspect because they terminated the first triad The next triad that in like manner bourgeois in this semipiternal spring which the nightly Aries despoils not perpetually sin Hosannah with three melodies which sound in the three orders of joy first Dominations and then Virtues the third order is of Powers Then in the two penultimate dances the Principalities and Archangels circle the last is wholly of Angelic sports These orders all gaze upward and downward so prevail that towards God all are drawn and all draw

THE THEORY of angels raises many questions regarding the similarity and difference between them and disembodied souls But for comparison with men perhaps the most striking consequences of the theory of angels as bodiless intelligences concern the manner of their knowledge and government The comparison can be made on quite different views of the nature of man and the soul In fact diverse conceptions of man or the soul can themselves be compared by reference to the angelic properties which one conception attributes to human nature and another denies

Lacking bodies the angels are without sense perception and imagination Not being immersed in time and motion they do not reason or think discursively as men do by reasoning from premises to conclusion Whereas human intellects according to Aquinas obtain their perfection in the knowledge of truth by a kind of movement and discursive intellectual operation as they advance from one known thing to another the angels from the knowledge of a known principle straightway perceive as known all its consequent conclusions with no discursive process at all Their knowledge is intuitive and immediate not by means of concepts abstracted from experience or otherwise formed but through the archetypal ideas infused in them at their creation by God That is why Aquinas goes on to say angels are called *intellectual beings* as contrasted with such *rational natures* as human souls which acquire knowledge of truth discursively If men possessed the fulness of intellectual light like the angels then in the first grasping of princi-

ples they would at once comprehend their whole range by perceiving whatever could be reasoned out from them.

It would appear from this that conceptions of the human intellect which minimize its dependence on sense and material intuition and which emphasize the intuitive rather than the discursive character of human thought attribute angelic power to man. The same may be said of theories of human knowledge which account for its origin in terms of innate ideas or implanted principles. Still another example of the attribution of angelic properties to man is to be found in the supposition that human beings can communicate with one another by telepathy. The angels are telepathic; one angel it is said can make its ideas known to another simply by an act of will and without any exterior means of communication.

Lacking bodies the angels are without bodily emotions free from the human conflict between reason and passion and completely directed in the choice—or the motion of their will—by what they know. In the *Divine Comedy* Beatrice speaks of the angelic society as one in which the Eternal Love disclosed himself in new loves. Addressing to the vision between the good and the bad angels she tells Dante those whom thou seest here were modest in grateful recognition of the Goodness which had made them apt for intelligence so great wherefore the vision was exalted with illuminant grace and by their merit so that they have full and steadfast vision. Yet their vision and love of God is not equal. In fact in the Primal Light that irradiates all is received in it by as many modes as are the spectators with whom the Light itself itself. Whence since the affection follows upon the act that conceives in this nature the sweetness of love directly glows and warms.

Such a society governed by knowledge and love has no need of the application of coercive force for angels are ordered to one another in such a way that no misunderstandings or discontents can occur among them. The philosopher Erasmus who proposes the ideal of a human society without restraint or coercion seems therefore to be aiming for heaven on earth. Considering government on earth in other terms

the writers of *The Federalist* remark that if men were angels no government would be necessary. If they had considered that the angelic society is governed by love alone and without force they might have said if men were angels no coercion would be necessary in their government.

One of the great theological dogmas asserts that from the beginning the angels are divided into two hosts—the good and evil spirits. The sin of Lucifer or Satan and his followers is that of disobedience or rebellion against God motivated by a pride which refuses to be satisfied with being less than God. As Satan himself says in *Paradise Lost*

pride and worse Ambition threw me down  
Warning! Heavy aagainst Heaven's matchless King  
All his good pro d ill in me  
And wrought but malice I sted up so high  
I stend subjection and thought one step higher  
Would set me highest and in a moment quit  
The debt immense of endless gratitude

And that w<sup>ld</sup>  
Did in forbid me and my dread of shame  
Among the spirits beneath whom I sed e d  
Then to submit boasting I co ld subdue  
Th Om ipotent

The theologians try to define precisely the nature of Satan's pride in wishing to be God.

To be as God Aquinas explains can be understood in two ways first by equality secondly by likeness. An angel could not seek to be as God in the first way because by natural knowledge he knew that this was impossible. And even supposing it were possible it would be against natural desire because there exists in everything the natural desire to preserve its own nature which would not be preserved were it to be changed into another nature. Consequently no creature of a lower nature can ever covet the grade of a higher nature just as an ass does not desire to be a horse.

It must be in the other way then Aquinas thinks that Satan sinned by wishing to be like God. But this requires further explanation. To desire to be as God according to likeness can happen in two ways. In one way as to that likeness whereby everything is likened unto God. And so if anyone desire in this way to be Godlike he commits no sin provided that he desires such likeness in proper order that is to

say that he may obtain it from God. But he would sin were he to desire to be like God even in the right way but of his own power and not of God's. In another way he may desire to be like God in some respect which is not natural to one e.g. if one were to desire to create heaven and earth which is proper to God in which desire there would be sin.

In this last way Aquinas asserts the devil desired to be as God. Not that he desired to resemble God by being subject to no one else absolutely for thus he would be destroying his own non-being since no creature can exist except by participating under God. But he desired as the last end of his beatitude something which he could attain by virtue of his own nature turning his appetite away from the super natural beatitude which is attained by God's grace.

In the original sin of Lucifer and the other fallen angels as well as in all subsequent intervention by Satan or his demons in the affairs of men lie the theological mysteries of the origin of evil in a world created by God's love and goodness and of the liberty of those creatures who while free can only do God's will. As indicated in the chapter on SIN the fall of Adam from grace and innocence involves the same mysteries. Man's destiny is connected with the career of Lucifer in traditional Christian teaching not only on the side of sin but also with regard to man's redemption—salvation replacing the fallen angels by the souls of the elect in the heavenly choir.

Among the most extraordinary moments in our literature are those in which Lucifer talks with God about mankind as in *Paradise Lost* or about a particular man as in the Book of Job or in the Prologue in Heaven in *Faust*. Their pagan parallel is the speech of Prometheus to a silent Zeus but Prometheus unlike Satan is man's benefactor and he can defy Zeus because the Fates whose secret he knows rule over the gods. Lucifer on the contrary seems always to be in the service of God. When he appears to Ivan in the *Brothers Karamazov* he protests I love men genuinely

and against the grain I serve to produce events and do what is irrational because I am

commanded to. If it were otherwise the warfare between the powers of light and darkness would have to be construed as a battle between equals which according to Christian orthodoxy is the Manichean heresy that regards the world as the battle ground of the forces of good and evil.

The word angelic usually has the connotation of perfect moral goodness but that must not lead us to forget that the demons are angelic in their nature although of a diabolical or evil will. Nor should the fact of Satan's subservience to God cause us to forget that Christian theology tries not to underestimate the power of the devil in his goings and comings on earth. Satan tried to tempt even Christ and throughout the New Testament the destruction of the diabolical influence over men occupies a prominent place. The intervention of the devil in man's life provides if not the theme the background of Goethe's *Faust*.

As the theory of demonic influences and diabolical possession is an integral part of the traditional doctrine of angels so in modern times demonology has been a major focus of attack upon theological teaching concerning spirits. Moralists have thought it possible to explain human depravity without recourse to the seductions of the devil and psychiatrists have thought it possible for men to go mad or to behave as if bewitched without the help of evil spirits. The idea of the devil according to Freud is a religious fiction—the best way out in acquittal of God for those who try to reconcile the undeniable existence of evil with His omnipotence and supreme goodness.

The characteristic skepticism of our age has been directed against the belief in angels generally. It casts doubt by satire or denies by argument the existence of spirits both good and evil. Yet all arguments considered may be considered whether the existence of angels—or in philosophical terms the existence of pure intelligences—is or is not still a genuine issue. Or are there two issues here one philosophical and the other theological one to be resolved or left unresolved on the level of argument the other to be answered dogmatically by the declarations of a religious faith?

## OUTLINE OF TOPICS

1 Inferior deities or dema gods in polyth.istic religion ... The philosophical consideration of pure intelligences, spiritual substances supra human persons ... a Th. celestial motors or secondary prime movers: the intelligences attached to the celestial bodies b Our knowledge of immaterial beings	10 11 12
3 The conception of an. el. in Judeo-Christian doctrine 3a The first creatures of God their place in the order of creation 3b The angelic nature 3c The aeternity and incorruptibility of angels 3d The angelic intellect and an. el. knowledge 3e The an. el. will and angelic love 3f Angelic action its characteristics in general 3g The angelic hierarchy the inequality, order and number of the angels and their relation to one another	13
4 Comparison of angels with men and with disembodied souls their relation to the blessed in th. hea. enly cho.	14
5 The distinction and comparison of the good and the bad an. els 5a The origin of the division between angels and demons the sin of Lucifer or Satan 5b The society of the demons the rule of Satan over the powers of darkness	15
6 The role of the angels in the government of the universe 6a The ministry of the good angels in the affairs of men guardianship 6b The intervention of the demons in the affairs of men temptation possession	16
God and Satan a Warfa. e betw. e n the powers of light and darkness their struggle for dominion over man b Lucifer in the service of God	17
8 Catholicism and satire with respect to th. belief in angels and demons	17

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad* BK II [265-283] 12d the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 1.

**PAGE SECTIONS** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page; the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS** One or more of the main divisions of a work (such as PART BK etc) are sometimes included in the reference line numbers in brackets are given in certain cases e.g. *Iliad* BK II [265-83] 12d.

**BIBLE REFERENCES** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e.g. OLD TESTAMENT *Nehemiah* 7:45-(D) *II Esdras* 7:46.

**SYMBOLS** The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas*; consult the Preface.

## *Chapter 2 ANIMAL*

### *INTRODUCTION*

ALPHABETICAL ordering places ANIMAL after ANGEL in this list of ideas. There is a third term which belongs with these two and but for the alphabet might have come between them. That term is MAN.

These three terms—and a fourth—God which rounds out the comparison—are joined in Shakespeare's statement of what is perhaps the most universal reflection of man upon himself. What a piece of work is man! says Hamlet. How noble in reason how infinite in faculty! in form and moving, how express and admirable! in action how like an angel! in apprehension how like a god! the beauty of the world! the paragon of animals! Animal angel god—in each of these man has seen his image. And at different moments in the history of thought he has tried to identify himself with one to the exclusion of the others.

Yet predominantly man has regarded him self as an animal even when he has understood himself to be created in God's image and to share with the angels through the possession of intellect the dignity of being a person. As his understanding of himself has varied so has he altered his conception of what it is to be an animal.

In terms of a conception of personality which involves the attributes of reason and free will man has legibly as well as morally and metaphysically drawn a sharp line between persons and things and placed brute animals in the class of things. According to the principle of the distinction being alive or even being sensitive does not give animals any more than plants and stones, the dignity or status of persons.

When man's animality—either in terms of his living qualities or his evolutionary origin—has seemed inadequate definition of his nature man has attributed to animals many of

his own traits his intelligence and freedom even his moral qualities and political propensities. Nevertheless he has seldom ceased to regard himself as the paragon of animals possessing in a higher degree than other animals the characteristic properties of all.

There are exceptions to this; however animals have been glorified by man for skeptical or satiric purposes.

Montaigne for example doubts that man can lay claim to any special attributes or excellencies and further suggests that in some particulars at least men are less able and less noble than the beasts. Relying on legends found in Pliny and Plutarch which describe the marvelous exploits of animals he argues that it is not upon any true ground of reason but by a foolish pride and vain opinion that we prefer ourselves before other animals and separate ourselves from their conditions and society.

Why Montaigne asks should we attribute to I know not what natural and servile inclination the works that surpass all we can do by nature and art? We have no grounds for believing that beasts by natural and compulsory tendency do the same things that we do by our choice and industry. Rather we ought he continues from like effects to conclude like faculties and consequently confess that the same reason the same method by which we operate are common with them or that they have others that are better.

Nor can we excuse our presumption of superiority by the fact that we are compelled to look at animals from our human point of view.

When I play with my cat Montaigne writes "who knows whether I do not make her more sport than she makes me? We mutually divert one another with our monkey tricks if I have my hour to begin or to refuse she also has hers. Suppose animals were to tell us what they

thought of us. The defect that hinders communication betwixt them and us why may it not be on our part as well as theirs? Tis yet to determine Montaigne thinks where the fault lies that we understand not one another for we understand them no more than they do us by the same reason they may think us to be beasts as we think them.

If Montaigne's view were to prevail no special significance could be given to brute as opposed to rational animal. For that matter the same holds true whenever man is conceived as just an animal patagon or not. Animals are brute only when man is not—only when to be human is to be somehow more than an animal different in kind not merely in degree.

Satirists like Swift idealize an animal nature to berate the folly and depravity of man. In his *First Voyage* Gulliver finds in the land of the Houyhnhnms a race of human looking creatures the Yahoos who by contrast with their noble masters the horses are a miserable and sorry lot. Here it is the Yahoos who are brutes bereft as they are of the intelligence and virtue which grace the splendid Houyhnhnms.

The comparison of men and animals takes still another direction in the allegories of fable and poetry. From Aesop to the medieval *Bestiaries* there is the tradition of stories in which animals are personified in order to teach a moral lesson. In the *Dante Comedy* Dante uses specific animals to symbolize the epitome of certain passions vices and virtues. The intent of his allegory is however never derogatory to man as man. But when Machiavelli allegorizes the qualities required for political power he advises the prince knowingly to adopt the beast and to choose the fox and the lion. This tends to reduce human society to the jungle where strength and guile compete for supremacy.

The comparison of men and animals fails to touch the distinction or lack of distinction between animals and plants. This is basic to the definition or conception of animal nature. As in the case of men and animals this problem can be approached in two ways either from the side of plant life and with respect to those functions which seem to be common to all living things or from the side of animal life and with respect to those functions which seem to belong only to

animals never to plants. On either approach the issue remains whether plants and animals are different in kind not merely in degree.

On the one hand it may be argued that sensitivity desire and locomotion (even perhaps sleeping and waking) are in some form or degree to be found in all living things. On the other hand it may be argued that such functions as nutrition growth and reproduction though obviously common to plants and animals are performed by animals in a distinctive manner. If plants manifest all the vital powers or activities present in animals or if in functions common to both animals differ only in degree then the scale of life would seem to be a continuous gradation rather than a hierarchy.

The opposite position which affirms a difference in kind and consequently a hierarchy is taken by Aristotle. In his biological writings as well as in his treatise *On the Soul* he draws a sharp line between plant and animal life by reference to faculties or functions absent in the one and found in the other. Aristotle first points out that living may mean thinking or perception or local movement and rest or movement in the sense of nutrition decay and growth. Hence he goes on we think of plants also as living for they are observed to possess in themselves an origenerative power through which they increase or decrease in all spatial directions they grow up and down and everything that grows increases its bulk alike in both directions or indeed in all and continues to live so long as it can absorb nutriment.

This led him to assign to plants what he calls a nutritive or vegetative soul whereby they have the three basic faculties common to all living things—nutrition growth and reproduction. But Aristotle does not find in plants any evidence of the functions performed by animals such as sensation appetite and local motion. These are the characteristic powers of the animal soul called by him the sensitive soul because sensation is the source both of animal desire and animal movement.

Galen follows Aristotle in this distinction. In his *Natural Faculties* he limits his investigations to the functions common to all living things. He uses the word natural for those effects such as growth and nutrition common to plants as well as animal which in his view

are opposed to such activities as feeling and voluntary motion peculiar to animals, that he calls effects of the soul or psychic. It may seem surprising at first that Galen's study of nutrition, growth, and reproduction—not only of the functions themselves but of the bodily organs and processes involved in these functions—should be restricted to their manifestation in animals and not in plants as well. The reason may be that for the naturalists of antiquity the biological functions of vegetable matter had not yielded their secrets readily enough to observation. A treatise on plants not written by Aristotle but attributed to his school begins with the remark that life is found in animals and plants but whereas in animals it is clearly manifest in plants it is hidden and less evident.

This view of the world of living things as divided into the two great kingdoms of plant and animal life prevailed through centuries of speculation and research. But from the time that Aristotle began the work of classification it has been realized that there exist numerous examples of what Bacon called bordering instances

such as exhibit those species of bodies which appear to be composed of two species or to be the rudiments between the one and the other.

Within the last hundred years the difficulty of classifying such specimens, particularly those which seem to fall between plant and animal has raised the question whether the traditional division can be maintained. If we look even to the two main divisions, namely to the animal and vegetable kingdoms, writes Darwin "certain low forms are so far intermediate in character that naturalists have disputed to which kingdom they should belong." Yet Darwin does not find the evidence available to him sufficient to determine whether all living things have descended from one primordial form or whether the evolution of life is to be represented in two distinct lines of development.

Since Darwin's day the researches of scientists like Leib and Jennings on the behavior of micro-organisms and the phenomena of tropisms (e.g. the sunflower's turning toward the sun) and the study of what appears to be local motion in plants have contributed additional evidence relevant to the issue. It is, however, still considered open and arguable.

The fact that organisms exist which do not readily fall into either classification may signify continuity rather than separation between plants and animals but it may also be taken to mean that more acute observations are required to classify these so-called intermediate forms. Plant tropisms may or may not require us to deny that sensitivity belongs to animals alone. The apparent local motion of plants may be a mode of growth or a random movement rather than a directed change from place to place and the attachment to place of apparently stationary animals, such as barnacles and mussel, may be different from the immobility of rooted plants.

Against the background of these major issues concerning plants, animals, and men as continuous or radically distinct forms of life the study of animal organisms—their anatomy and physiology—acquires much of its critical significance.

Anatomy is an ancient science. Several surgical treatises of Hippocrates display an extensive knowledge of the human skeletal structure and the disposition of some of the organs of the human body. The dissection of animals as well as gross observation provides Aristotle with a basis for the comparative anatomy of different species of animal. For Galen as well as Aristotle much of this anatomical study was motivated by an interest in the structure and relation of the organs involved in the local motion of the body as a whole and in local motions within the body such as the motions of the alimentary or reproductive systems.

It remains for a later investigator schooled in the tradition of ancient biology to make the startling discovery of the circulation of the blood through the motions of the heart. Harvey not only does this but he also suggests the functional interdependence of respiration and circulation based on his observation of the intimate structural connections between heart arteries, veins, and lungs. His contribution is at once a departure from and a product of the scientific tradition in which he worked for though his conclusions are radically new he reaches them by a method of research and reasoning which follows the general principles of Aristotle and Galen. His insistence, moreover,

thought of us. The defect that hinders communication betwixt them and us why may it not be on our part as well as theirs? Tis yet to determine Montaigne thinks where the fault lies that we understand not one another for we understand them no more than they do us by the same reason they may think us to be beasts as we think them.

If Montaigne's view were to prevail no special significance could be given to brute as opposed to rational animal. For that matter the same holds true whenever man is conceived as just an animal paragon or not. Animals are brute only when man is not—only when to be human is to be somehow more than an animal different in kind not merely in degree.

Satirists like Swift idealize in animal nature to berate the folly and depravity of man. In his last voyage Gulliver finds in the land of the Houyhnhnms a race of human looking creatures the Yahoos who by contrast with their noble masters the horses are a miserable and sorry lot. Here it is the Yahoos who are brutes bereft as they are of the intelligence and virtue which grace the splendid Houyhnhnms.

The comparison of men and animals takes still another direction in the allegories of fable and poetry. From Aesop to the medieval Bestiaries there is the tradition of stories in which animals are personified in order to teach a moral lesson. In the *Divine Comedy* Dante uses specific animals to symbolize the epitome of certain passions vices and virtues. The intent of his allegory is however never derogatory to man as man. But when Machiavelli allegorizes the qualities required for political power he advises the prince knowingly to adopt the beast and to choose the fox and the lion. This tends to reduce human society to the jungle where strength and guile compete for supremacy.

The comparison of men and animals fails to touch the distinction or lack of distinction between animals and plants. This is basic to the definition or conception of animal nature. As in the case of men and animals this problem can be approached in two ways either from the side of plant life and with respect to those functions which seem to be common to all living things or from the side of animal life and with respect to those functions which seem to belong only to

animals never to plants. On either approach the issue remains whether plants and animals are different in kind not merely in degree.

On the one hand it may be argued that sensitivity desire and locomotion (even perhaps sleeping and waking) are in some form or degree to be found in all living things. On the other hand it may be argued that such functions as nutrition growth and reproduction though obviously common to plants and animals are performed by animals in a distinctive manner. If plants manifest all the vital powers or activities present in animals or if in functions common to both animals differ only in degree then the scale of life would seem to be a continuous gradation rather than a hierarchy.

The opposite position which affirms a difference in kind and consequently a hierarchy is taken by Aristotle. In his biological writings as well as in his treatise *On the Soul* he draws a sharp line between plant and animal life by reference to faculties or functions absent in the one and found in the other. Aristotle first points out that living may mean thinking or perception or local movement and rest or movement in the sense of nutrition decay and growth. Hence "he goes on we think of plants also as living for they are observed to possess in themselves an originative power through which they increase or decrease in all spatial directions they grow up and down and everything that grows increases its bulk alike in both directions or indeed in all and continue to live so long as it can absorb nutriment."

This leads him to assign to plants what he calls a nutritive or vegetative soul whereby they have the three basic faculties common to all living things—nutrition growth and reproduction. But Aristotle does not find in plants any evidence of the functions performed by animals such as sensation appetite and local motion. These are the characteristic powers of the animal soul called by him the sensitive soul because sensation is the source both of animal desire and animal movement.

Galen follows Aristotle in this distinction. In his *Natural Faculties* he limits his investigations to the functions common to all living things. He uses the word natural for those effects such as growth and nutrition common to plants as well as animal which in his view

der licks, the lizard an organ of locomotion which the oyster lacks. The sponge lives in one manner so far as locale is concerned and the per in another reptiles have one manner of locomotion birds another. So ample were Aristotle's data and so expert were his classifications that the major divisions and sub-divisions of his scheme remain intact in the taxonomy constructed by Linnaeus.

The radical character of Darwin's departure from the Linnaean classification stems from a difference in principle rather than a correction of observational errors or inadequacies. Where Aristotle and all taxonomists before Darwin classify animals by reference to their similarities and differences, Darwin makes inserted genealogy or descent the primary criterion in terms of which he groups animals into varieties, species, genera and larger phyla.

Naturalists according to Darwin try to arrange the species, genera and families in each class, on what is called the Natural System. But what is meant by this system? Some authors look at it merely as a scheme for arranging together those living objects which are most alike and for separating those which are most unlike.

The intricacy and utility of this system are indubitable, but Darwin thinks that its rules cannot be explained or its difficulties overcome except on the view that the Natural System is founded on descent with modification—that the characters which naturalists consider as showing true affinity between any two or more species, are those which have been inherited from a common parent; all true classification being genealogical—that communism of descent is the hidden bond which naturalists have been unconsciously seeking and not some unknown plan of creation or the enunciation of general proportion and the mere putting together and separating objects more or less alike.

In Darwin's opinion classification must be strictly genealogical in order to be natural. Only by the principle of descent—the one and only known cause of similarity in organic beings—can we arrange all organic beings throughout all time in groups under groups, see that nature of the relation holds which shall be simple and easy to grasp, are united by complex relations, and in various lines of affinities to a few grand classes and understand the

wide opposition in value between analogical or adaptive characters and characters of true affinity. Furthermore the importance of embryological characters and of rudimentary organs in classification becomes intelligible on the view that a natural arrangement must be genealogical. By reference to this element of descent not only shall we be able to understand what is meant by the Natural System but also Darwin adds our classifications will come to be as far as they can be so made genealogies and will then truly give what may be called the plan of creation.

Whereas the Aristotelian classification is static in principle having no reference to temporal connections or the succession of generations, the Darwinian is dynamic—almost a moving picture of the ever shifting arrangement of animals according to their affinities through common ancestry or their diversities through genetic variation. Connected with this opposition between static and dynamic principles of classification is a deeper conflict between two ways of understanding the nature of scientific classification itself.

The point at issue is whether the classes which the taxonomist constructs represent distinct natural forms. Do they exist independently as objects demanding scientific definition or are the scientist's groupings somewhat arbitrary and artificial? Do they divide and separate what in nature is more like a continuous distribution with accidental gaps and unevennesses? This issue in turn tends to raise the metaphysical question concerning the reality and fixity of species, which relates to the problem of the difference between real and nominal definitions and the difference between a natural and arbitrary systems of classification.

On these matters Aquinas and Locke have much to say, as well as Aristotle and Darwin. Further discussion of such questions is to be found in the chapters on DEFINITION and EVOLUTION. Insofar as problems of classification and the nature of species have a bearing on evolution they are treated in that chapter as are the related issues of continuity or hierarchy in the world of living things and of difference in degree or kind as between plants and animals, animals and men. The last two problems also occur in the chapters on LIFE and MAN.

on the necessity of finding a functional purpose for an organic structure stands as the classic rejoinder to Francis Bacon's recommendation that formal and final causes be separated from material and efficient causes in the study of nature. Bacon assigns the first two types of cause to metaphysics and limits physics to the last two.

Harvey's work on the generation of animals is another example of the continuity between ancient and modern biology. In some respects Aristotle's researches on the reproductive organs and their functions are more general than Harvey's. They represent for him only part of the large field of comparative anatomy and have significance for the study of mating habits in different classes of animals. Yet on the problem of the act of generation itself, its causes and consequences especially the phenomena of embryonic development, Harvey's treatise reads partly as a conversation with Aristotle and partly as the record of original observations undertaken experimentally.

Respect for our predecessors and for antiquity at large he writes inclines us to defend their conclusions to the extent that love of truth will allow. Nor do I think it becoming in us to neglect and make little of their labors and conclusions who bore the torch that has lighted us to the shrine of philosophy. The ancients in his opinion by their unwearyed labor and variety of experiments searching into the nature of things have left us no doubtful light to guide us in our studies. Yet Harvey adds no one of a surety will allow that all truth was engrossed by the ancients unless he be utterly ignorant of the many remarkable discoveries that have lately been made in anatomy. Referring to his own method of investigation he proposes as a safer way to the attainment of knowledge that in studying nature we question things themselves rather than by turning over books.

It is particularly with respect to animal generation that the great books exhibit continuity in the statement of basic problems in biology as well as indicate the logical conditions of their solution. The issue of spontaneous generation as opposed to procreation runs through Aristotle, Lucretius, Aquinas, Harvey, and Darwin. The problem of sexual and asexual repro-

duction with all the relevant considerations of sexual differentiation and sexual characteristics, is to be found in Aristotle, Darwin, and Freud. Questions of heredity though they are raised with new significance by Darwin and William James have a lineage as ancient as Plato.

Scientific learning has of course advanced in recent times with regard to the nature and behavior of animals. On such topics as heredity the work of Mendel, Bateson, and Morgan is crucial or to take another example our knowledge of the functioning of the respiratory and the nervous system has been greatly enlarged by the researches of Haldane, Sherrington, and Pavlov. Yet even in these areas the background of recent scientific contributions is to be found in the great books—in the writings for example of Harvey, Darwin, and William James.

ANOTHER INTEREST which runs through the whole tradition of man's study of animals lies in the problem of their classification—both with respect to the principles of taxonomy itself and also in the systematic effort to construct schemes whereby the extraordinary variety of animal types can be reduced to order. In this field Aristotle and Darwin are the two great masters. If the names of Buffon and Linnaeus also deserve to be mentioned it must be with the double qualification that they are followers of Aristotle on the one hand and precursors of Darwin on the other.

The Aristotelian classification is most fully set forth in the *History of Animals*. There one kind of animal is distinguished from another by many properties by locale or habitat by shape and color and size by manner of locomotion, nutrition, association, sensation by organic parts and members by temperament in stinct or characteristic habits of action. With respect to some of these properties Aristotle treats one kind of animal as differing from another by a degree—by more or less—of the same trait. With respect to other properties he finds the difference to consist in the possession by one species of a trait totally lacking in another. He speaks of the lion as being more ferocious than the wolf, the crow as more cunning than the raven, but he also observes that the cow has an organ of digestion which the spi-

exact opposite of action based upon free will. It is completely determined by the unborn pattern of the instinct. It may vary in operation with the circumstances of the occasion, but it does not leave the animal the freedom to act or not to act or to act this way rather than that. Such freedom of choice, Aquinas holds, depends on reason's ability to contemplat al ius et ius, to none of which is the human will bound by natural necessity.

Animals do not limit human reason and will to a role analogous to the one he ascribes to instinct and emotion in animal life. Their power enables man to exert in speculate through and to seek remot ends. Nevertheless, on the level of his biological need man must resort to the use of his reason and will where other animals are guided by instinct. "Man has by nature," Aquinas writes, "his reason and his hands, which are the organs of others since by their means man can make for himself instruments of an infinite variety and for any number of purposes. Just as the prodigies of reason take the place of hair, hoofs, claws, teeth, and horns—fixed means of defense or of defense—as is the case with other animals"—so reason serves man's needs, in the view of Aquinas as in fact serves all animals.

Others, like Darwin, James, and Freud seem to take a different view. They attribute instinct to men as well as to animals. In their opinion man's intuitively determined behavior is influenced by intelligence and affected by memory and imagination, as animals as well as men. They recognize however that man's predilections in some of the lower forms of animal life, and acknowledge that the combination of intelligence is great only among the more highly developed organisms.

"Man has a far greater variety of instincts than the lower animal," writes James, and any one of those studies taken in itself is blind to the lowest instinct can be, but owing to man's enormous power of reflection, and power of inference they come each one to be felt by him as if he were blind to them and experience the result a connection with a few of those results. On the same grounds, James argues that every creature acts on an animal's memory, except it will be forced after being once deceived and must be commanded

with foresight of its end just so far as that end may have failed under the animal's countenance."

If instinct, in animals or men were sufficient for solving the problems of survival, there would be no need for what James calls "sagacity" on the part of animals, or of learning from experience. Like Montaigne, James assembles anecdotes to show that animals exercise their wits and learn from experience. No matter how well endowed an animal may originally be in the way of instincts, James declares, his resultant actions will be much modified if the instincts combine with experience. If in addition to impulses he have memories, associations, inferences, and expectations, on any considerable scale.

In his consideration of the intellectual contrast between brute and man, James places the most elementary single difference between the human mind and that of brutes" in the deficiency on the brutes' part to associate ideas by imitation, so that characterizes the abstraction of which depends on this sort of association, most in the brute always remain drowned. Darwin similarly makes the difference in degree between human and animal intelligence a matter of greater or less power to associate ideas. In consequence human instincts are much more modified by learning and experience than the instincts of other animals, as in turn the higher animals show much greater variability in their instinctive behavior than do lower organisms.

It is not necessary to deny that men alone have reason in order to affirm that in addition to instinct animals have intelligence in some proportion to the development of their sensitive powers, especially their memory and imagination. The position of Aristotle and Aquinas seems to involve both points. But if we attribute the extraordinary performances of animals to their intelligence alone, rather than primarily to instinct, then we are led to conclude with Montaigne that they possess no more than a sensible intelligence, or a reasoning intellect.

Why does the spider make her web in one place and sacrifice it another? Montaigne asks. Why now one sort of knot and then another if she has not deliberation thought and conclusion?" And in another

ON THE THEME of comparisons between animals and men two further points should be noted

The first concerns the soul of animals. When soul is conceived as the principle or source of life in whatever is alive plants and animals can be said to have souls. Like Aristotle Augustine distinguishes three grades of soul in universal nature one which has only the power of life the second grade in which there is sensation the third grade where intelligence has its throne.

Though he also follows Aristotle in defining three kinds of soul Aquinas distinguishes four grades of life and in so doing differentiates between perfect and imperfect animals. There are some living things he writes in which there exists only vegetative power as the plants. There are others in which with the vegetative there exists also the sensitive but not the loco motive power such are immovable animals as shellfish. There are others which besides this have locomotive power as perfect animals which require many things for their life and consequently movement to seek the necessities of life from a distance. And there are some living things which with these have intellective power—namely men.

On this theory man viewed in terms of his animal nature is a perfect animal. Viewed in terms of his reason or intellect he stands above the highest animals. Yet having a soul is not peculiar to man just as being alive or sensitive or mobile is not. But when as with Descartes soul is identified with intellect—as a thing which thinks that is to say a mind—or an understanding or a reason—and in addition soul is conceived as a spiritual and immortal substance then the conclusion seems to follow that animals do not have souls.

For Descartes the theory of the animal as a machine or automaton follows as a further corollary. If there had been such machines possessing the organs and outward form of a monkey or some other animal without reason Descartes claims that we should not have had any means of ascertaining that they were not of the same nature as those animals. Hobbes likewise would account for all the actions of animal life on mechanical principles. For what is the heart but a spring he asks and the

nerves but so many strings and the joints but so many wheels giving motion to the whole body? The animal is thus pictured as an elaborate system of moving parts inflexibly determined to behave in certain ways under the impact of stimulation by external forces.

The doctrine of the animal automaton is sometimes generalized as by La Mettrie a follower of Descartes to include the conception of man as a machine. The same conclusions which are reached from the denial of soul in animals seem to follow also from the theory that the soul even in the case of man is material or a function of matter. According to those who like Lucretius hold this view the phenomena of life sensation and thought can be explained by the movement of atomic particles and their interaction.

The second point concerns the relation between instinct and intelligence in animals. The nature of animal instincts (or innate habits) is considered in the chapters on Emotion and Habit as is the nature of animal intelligence in the chapters on Man and Reasoning. But here we face the issue whether instinct functions in animals as reason does in man to meet the exigencies of life or whether in both though varying in degree intelligence cooperates with instinct to solve the problems of adjustment to environment.

Those who like Aquinas regard instinct and reason as the alternative and exclusive means which God provides for the ends of animal and human life necessarily tend to interpret animal behavior in all its detail as pre-determined by elaborate instinctive endowments. Accordingly animal behavior even when voluntary rather than purely the action of physiological reflexes is said not to be free or an expression of free choice on the part of the animal for as is pointed out in the chapter on Will Aquinas calls behavior voluntary if it involves some knowledge or consciousness of the objects to which it is directed.

Instinctive behavior such as in animals flight from danger or its pursuit of food or a mate involves sense perception of the objects of these actions as well as feelings or emotions about them. But though it is voluntary in the sense in which Aquinas uses that word instinctive behavior is according to him the

exact opposite of act on based upon free will. It is completely determined by the inborn pattern of the instinct. It may vary in operation with the circumstances of the occasion, but it does not leave the animal the freedom to act or not to act or to act this way rather than that. Such freedom of choice Aquinas holds depends on reason's ability to contemplate alternatives to none of which is the human will bound by natural necessity.

Aquinas does not limit human reason and will to a role analogous to the one he ascribes to instinct and emotion in animal life. Their power enables man to engage in speculative thought and to seek remote ends. Nevertheless on the level of his biological needs man must resort to the use of his reason and will where other animals are guided by instinct. Man has by nature Aquinas writes his reason and his hands, which are the organs of organs since by their means man can make for himself innumerable acts of an infinite variety and for any number of purposes. Just as the product of reason take the place of hair, hoofs, claws, teeth and horns—fixed means of defense or of clothing as is the case with other animals—so reason serves man's need in the view of Aquinas as instinct serves other animals.

Others like Darwin, James and Freud seem to take a different view. They attribute instinct to men as well as to animals. In their opinion instinctively determined behavior is influenced by intelligence and affected by memory and imagination in animals as well as in men. They recognize however that instinct predominates in some of the lower forms of animal life and acknowledge that the contribution of intelligence is great only among the more highly developed organisms.

Man has a large variety of impulses than any other animal, says James, and any one of these impulses taken in itself is blind and the lowest instinct can be but owing to man's memory power of reflection and power of inference they come each one to be felt by him first he has on reflected to them and experienced the result in connection with a series of those results. On the same grounds James argues that every instinctive act in an animal such memory must be so to be blind after being repeated and must be accompanied

with foresight of its end just so far as that end may have fallen under the animal's cognizance.

If instinct in animals or men were sufficient for solving the problems of survival there would be no need for what James calls sagacity on the part of animals, or of learning from experience. Like Montaigne James assembles anecdotes to show that animals exercise their wits and learn from experience. No matter how well endowed an animal may originally be in the way of instincts James declares his resultant actions will be much modified if the instincts combine with experience. If in addition to impulses he have memories, associations, inferences and expectations on any considerable scale.

In his consideration of the intellectual contrast between brute and man James places the most elementary single difference between the human mind and that of brutes in the deficiency on the brute's part to associate ideas by utility, so that characterizes the abstraction of which depends on this sort of association must in the brute always remain drowned. Darija similarly makes the difference in degree between human and animal intelligence a matter of greater or less power to associate ideas. In consequence human instincts are much more modified by learning and experience than the instincts of other animals, as in turn the higher animals show much greater variability in their instinctive behavior than do lower organisms.

It is not necessary to deny that men alone have reason in order to affirm that in addition to instinct animals have intelligence in some proportion to the development of their sensitive powers especially their memory and imagination. The position of Aristotle and Aquinas seems to involve both points. But if we attribute the extraordinary performances of animals to their intelligence alone rather than primarily to instinct then we are led to conclude with Montaigne that they possess not merely a sensitive intelligence but a reasoning intelligence.

Why does the spider make her web so tight in one place and slack in another? Montaigne asks. Why non one sort of knot and then another if she has not deliberation, thought and conclusion? And in another

place he asks What is there in our intelligence that we do not see in the operations of animals? Is there a polity better ordered the offices better distributed and more inviolably observed and maintained than that of bees? Can we imagine that such and so regular a distribution of employments can be carried on without reason and prudence?

GREGARIOUSNESS in animals and the nature of animal communities are considered in the chapter on STATE in connection with the formation of human society But so far as human society itself is concerned the domestication of animals signifies an advance from primitive to civilized life and an increase in the wealth and power of the tribe or city

Aeschylus includes the taming of animals among the gifts of Prometheus who first brought under the yoke beasts of burden who by draft and carrying relieved men of their hardest labors yoked the proud horse to the chariot teaching him obedience to the reins to be the adornment of wealth and luxury The *Iliad* pays eloquent testimony to the change in the quality of human life which accompanied the training of animals to respond to human command Homer's reference to Castor as breaker of horses indicates the sense of conquest or mastery which men felt when they subdued wild beasts and the oft repeated Homeric epithet horse taming which is intended as a term of praise for both the Argives and the Trojans implies the rise of a people from barbarous or primitive conditions—their emancipation from the discomorts and limitations of animal life

Aristotle points out that one mark of wealthy men is the number of horses which they keep for they cannot afford to keep them unless they are rich For the same reason he explains in old times the cities whose strength lay in their cavalry were oligarchies

Legend and history are full of stories of the loyalty and devotion of animals to their human masters and of the reciprocal care and affection which men have given them But motivated as it is by their utility for economic or military purposes the breaking of animals to human will also frequently involves a violent or wanton misuse

The use or even the exploitation of animals by man seems to be justified by the inferiority of the brute to the rational nature As plants exist for the sake of animals so animals according to Aristotle exist for the sake of man the tame for use and food the wild if not all at least the greater part of them for food and for the provision of clothing and various instruments Aristotle's conception of the natural slave discussed in the chapter on SLAVERY uses the domesticated animal as a kind of model for the treatment of human beings as tools or instruments

Though he does not share Aristotle's view that some men are by nature slaves Spinoza takes a comparable position with regard to man's domination and use of animals The law against killing animals he writes is based upon an empty superstition and womanish tenderness rather than upon sound reason A proper regard indeed to one's own profit teaches us to unite in friendship with men and not with brutes nor with things whose nature is different from human nature I by no means deny he continues that brutes feel but I do deny that on this account it is unlawful for us to consult our own profit by using them for our pleasure and treating them as is most convenient to us inasmuch as they do not agree in nature with us

But other moralists declare that men can be friend animals and insist that charity if not justice should control man's treatment of beasts Nor is such contrary teaching confined to Christianity or to the maxims of St Francis who would persuade men to love not only their neighbors as themselves but all of God's creatures Plutarch for instance argues that although law and justice we cannot in the nature of things employ on others than men nevertheless we may extend our goodness and charity even to irrational creatures In kindness to dumb animals he finds the mark of the gentle nature —the sign of a man's humanity Towards human beings as they have reason behave in a social spirit says Marcus Aurelius but he also writes As to animals which have no reason and generally all things and objects do thou since thou hast reason and they have none make use of them with a generous and liberal spirit

place he asks What is there in our intelligence that we do not see in the operations of animals? Is there a polity better ordered the offices better distributed and more inviolably observed and maintained than that of bees? Can we imagine that such and so regular a distribution of employments can be carried on without reason and prudence?

GREGARIOUSNESS in animals and the nature of animal communities are considered in the chapter on STATE in connection with the formation of human society. But so far as human society itself is concerned the domestication of animals signifies an advance from primitive to civilized life and an increase in the wealth and power of the tribe or city.

Aeschylus includes the taming of animals among the gifts of Prometheus who first brought under the yoke beasts of burden who by draft and carrying relieved men of their hardest labors yoked the proud horse to the chariot teaching him obedience to the reins to be the adornment of wealth and luxury. The *Iliad* pays eloquent testimony to the change in the quality of human life which accompanied the training of animals to respond to human command. Homer's reference to Castor as breaker of horses indicates the sense of conquest or mastery which men felt when they subdued wild beasts and the oft repeated Homeric epithet horse taming which is intended as a term of praise for both the Argives and the Trojans implies the rise of a people from barbarous or primitive conditions—their emancipation from the discomorts and limitations of animal life.

Aristotle points out that one mark of wealthy men is the number of horses which they keep for they cannot afford to keep them unless they are rich. For the same reason he explains in old times the cities whose strength lay in their cavalry were oligarchies.

Legend and history are full of stories of the loyalty and devotion of animals to their human masters and of the reciprocal care and affection which men have given them. But motivated as it is by their utility for economic or military purposes the breaking of animals to human will also frequently involves a violent or wanton misuse.

The use or even the exploitation of animals by man seems to be justified by the inferiority of the brute to the rational nature. As plants exist for the sake of animals so animals according to Aristotle exist for the sake of man the tame for use and food the wild if not all at least the greater part of them for food and for the provision of clothing and various instruments. Aristotle's conception of the natural slave discussed in the chapter on SLAVERY uses the domesticated animal as a kind of model for the treatment of human beings as tools or instruments.

Though he does not share Aristotle's view that some men are by nature slaves Spinoza takes a comparable position with regard to man's domination and use of animals. The law against killing animals he writes is based upon an empty superstition and womanish tenderness rather than upon sound reason. A proper regard indeed to one's own profit teaches us to unite in friendship with men and not with brutes nor with things whose nature is different from human nature. I by no means deny he continues that brutes feel but I do deny that on this account it is unlawful for us to consult our own profit by using them for our pleasure and treating them as is most convenient to us inasmuch as they do not agree in nature with us.

But other moralists declare that men can be friend animals and insist that charity if not justice should control man's treatment of beasts. Nor is such contrary teaching confined to Christianity or to the maxims of St Francis, who would persuade men to love not only their neighbors as themselves but all of God's creatures. Plutarch for instance argues that although law and justice we cannot in the nature of things employ on others than men nevertheless we may extend our goodness and charity even to irrational creatures. In kindness to dumb animals he finds the mark of the gentle nature—the sign of a man's humanity. Towards human beings as they have reason behave in a social spirit says Marcus Aurelius but he also writes As to animals which have no reason and generally all things and objects do thou since thou hast reason and they have none make use of them with a generous and liberal spirit.

place he asks What is there in our intelligence that we do not see in the operations of animals? Is there a polity better ordered the offices better distributed and more inviolably observed and maintained than that of bees? Can we imagine that such and so regular a distribution of employments can be carried on without reason and prudence?

GREGARIOUSNESS in animals and the nature of animal communities are considered in the chapter on STATE in connection with the formation of human society. But so far as human society itself is concerned the domestication of animals signifies an advance from primitive to civilized life and an increase in the wealth and power of the tribe or city.

Aeschylus includes the taming of animals among the gifts of Prometheus who first brought under the yoke beasts of burden who by draft and carrying relieved men of their hardest labors. Yoked the proud horse to the chariot teaching him obedience to the reins to be the adornment of wealth and luxury. The *Iliad* pays eloquent testimony to the change in the quality of human life which accompanied the training of animals to respond to human command. Homer's reference to Castor as breaker of horses indicates the sense of conquest or mastery which men felt when they subdued wild beasts and the oft repeated Homeric epithet horse taming which is intended as a term of praise for both the Argives and the Trojans implies the rise of a people from barbarous or primitive conditions—their emancipation from the discomfets and limitations of animal life.

Aristotle points out that one mark of wealthy men is the number of horses which they keep for they cannot afford to keep them unless they are rich. For the same reason he explains in old times the cities whose strength lay in their cavalry were oligarchies.

Legend and history are full of stories of the loyalty and devotion of animals to their human masters and of the reciprocal care and affection which men have given them. But motivated as it is by their utility for economic or military purposes the breaking of animals to human will also frequently involves a violent or wanton misuse.

The use or even the exploitation of animals by man seems to be justified by the inferiority of the brute to the rational nature. As plants exist for the sake of animals so animals according to Aristotle exist for the sake of man the time for use and food the wild if not all at least the greater part of them for food and for the provision of clothing and various instruments. Aristotle's conception of the natural slave discussed in the chapter on SLAVERY uses the domesticated animal as a kind of model for the treatment of human beings as tools or instruments.

Though he does not share Aristotle's view that some men are by nature slaves Spinoza takes a comparable position with regard to man's domination and use of animals. The law against killing animals he writes is based upon an empty superstition and womanish tenderness rather than upon sound reason. A proper regard indeed to one's own profit teaches us to unite in friendship with men and not with brutes nor with things whose nature is different from human nature. I by no means deny he continues that brutes feel but I do deny that on this account it is unlawful for us to consult our own profit by using them for our pleasure and treating them as most convenient to us inasmuch as they do not agree in nature with us.

But other moralists declare that men can befriend animals and insist that charity if not justice should control man's treatment of beasts. Nor is such contrary teaching confined to Christianity or to the maxims of St Francis who would persuade men to love not only their neighbors as themselves but all of God's creatures. Plutarch for instance argues that although law and justice we cannot in the nature of things employ on others than men nevertheless we may extend our goodness and charity even to irrational creatures. In kindness to dumb animals he finds the mark of the gentle nature—the sign of a man's humanity. Towards human beings as they have reason behave in a social spirit says Marcus Aurelius but he also writes As to animals which have no reason and generally all things and objects do thou since thou hast reason and they have none make use of them with a generous and liberal spirit.

## REFERENCES

To find the passages cited, use the numbers in heavy type which are the volume and page numbers of the passus referred to. For example in **4 Hume** [that is v. 11] 65 283] 12d the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 1.

**P or Secu** vs When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example in [53] v. 5 Psychology 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page and c and d to the upper and lower halves of the right hand side of the page. For example, in **7 PLATO Symposion** 163b-164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**ARTICULOS** D is o s One or more of the main divisions of a work (such as PART, BK, CH, §, CT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases e.g. **Hume** BK II [65, 283] 12d.

**B & R** THESES Theses are book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows e.g. **Old TESTAMENT** Nehemiah 45-(D) II Ed. 25 7-6.

**STUBBLES** Th. abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. Passim signifies that the topic is discussed intermittently rather than continuously in the work or passus cited.

For additional information concerning the style of the references, see the Explanation of Reference Style for general guidance in the use of *The Great Lexicon* in the Pt face.

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in *4 Homer Ilad BK II* [165, 283] 12d the number 4 is the number of the volume in the set, the number 12d indicates that the passage is section d of page 12.

**Page Sections.** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example in *531 men Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page; the letters c and d to the upper and lower halves of the right hand side of the page. For example in *7 Plato Symposium* 163b-164c the passage begins in the lower half of the left hand side [pa c 163] and ends in the upper half of the right hand side of page 164.

**Altars or Divisions.** One or more of the main divisions of a work (such as PART BK CH 2C) are sometimes included in the reference line numbers in brackets are given in certain cases e.g. *Iliad BK II* [165, 283] 12d.

**Bible References.** The references are to book chapter and verse. When the King James and Douay version differ in title of books or in the numbering of chapters or verses, the King James vers or is cited first and the Douay indicated by a (D) follows e.g. Old Test MATT Nekemah, 45-(D) II Esdras 7:46.

**Sects.** The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. Passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas*; consult the Preface.

the one or the many exercise political power and dominate the state. By this criterion of number aristocracy is always differentiated from monarchy and democracy.

Though he uses the word oligarchy to name what others call aristocracy, Locke defines the three forms of government by reference to numbers. When the majority themselves exercise the whole power of the community, Locke says, "then the form of the government is a perfect democracy. When they put the power of making laws into the hands of a few select men, then it is an oligarchy; or else into the hands of one man, and then it is a monarchy." Kant proceeds similarly though again in somewhat different language. The relation of the supreme power to the people he says, is conceivable in three different forms either *one* in the state rules *all* or *some* *selected* in relation of equality with each other rule over all the others or *all* together rule over each *several* dually including themselves. The form of the state is therefore either *autocracy* or *aristocracy* or *democracy*.

Herodotus claims, however, that purely quantitative distinction like these are only superficial and do not afford the concept of the third. The criterion of number does not seem to suffice when other forms of government are considered. It fails to distinguish monarchy from tyranny or despotism which may consist of rule by one man, as has usually been the case hitherto. Number alone likewise fails to distinguish aristocracy from oligarchy. In the deliberations of the Medean conspirators, which Herodotus reports, in which the rule of a certain number of the worthiest is set against both democracy and monarchy and identified as oligarchy. How then shall aristocracy be distinguished from oligarchy?

There seem to be two answers to this question. In the *Statesman* Plato adds to the criterion of number the criterion of law and the absence of law. The holders of political power whatever the number may govern either according to the established laws, or by arbitrary caprice in violation of them. To go against the laws which are based upon long experience and the wisdom of counsellors who have graciously recommended them and persuaded the multitude to pass them, would be "

the Eleatic Stranger declares in the *Statesman*, "a far greater and more serious error than any adherence to written law."

Taking the division of governments according to number "the principle of law and the absence of law will bisect them all. Monarchy divides into royalty and tyranny depending on whether an individual rules according to law or governs neither by law nor by custom, but pretends that he can only act for the best by violating the laws while in reality appetite and ignorance are the motives." By the same criterion the rule of the few divides into aristocracy which has an auspicious name and oligarchy. While democracy is subject to the same division, Plato makes the same name apply to both its good and bad forms.

The second way in which aristocracy differs from oligarchy is also brought out in the *Statesman*. Since "the science of government" according to Plato is among the greatest of all sciences and most difficult to acquire, any true form of government can only be supposed to be the government of one, two or at any rate of a few "really found to possess science." Because of this demand for "science" which presupposes virtue and competence in ruling, monarchy and aristocracy came to be defined as government by the single best man or by the few best men in the community.

A high degree of competence or virtue is, however, not the only mark by which the few may be distinguished from the many. The possession of wealth or property in any sizeable amount also seems to divide a small class in the community from the rest. And Plato at times refers to aristocracy simply as the government of the rich. Yet if wealth is the criterion by which the few are chosen to govern than oligarchy results at least in contrast to that sense of aristocracy in which the criterion is excellence of mind and character. Aristocracy is called aristocracy writes Aristotle "either because the rulers are the best men, or because they have at heart the best interests of the state and of the citizens."

By these additional criteria—neither by numbers alone—the ancestors conceive aristocracy. When it is so defined it always appears to be a good form of government but not the only good form, or even the best. The same

# Chapter 3 ARISTOCRACY

## INTRODUCTION

THE forms of government have been variously enumerated differently classified and given quite contrary evaluations in the great books of political theory. In the actual history of political institutions as well as in the tradition of political thought the major practical issues with respect to the forms of government—the choices open the ideals to be sought or the evils to be remedied—have shifted with the times.

In an earlier day—not merely in ancient times but as late as the 18th century—the form of government called aristocracy presented a genuine alternative to monarchy and set a standard by which the defects and infirmities of democracy were usually measured. If aristocracy was not always regarded as the ideal form of government the principle of aristocracy always entered into the definition of the political ideal.

Today both in theory and practice aristocracy is at the other end of the scale. For a large part of mankind and for the political philosopher as well as in prevailing popular sentiment aristocracy (together with monarchy) has become a subject of historical interest. It is a form of government with a past rather than a future. It no longer measures but is measured by democracy. If the aristocratic principle still signifies a factor of excellence in government or the state it does so with a meaning now brought into harmony with democratic standards.

This change accounts for one ambiguity which the word aristocracy may have for contemporary readers. Formerly its primary if not only significance was to designate a form of government. It is currently used to name a special social class separated from the masses by distinctions of birth, talent, property, power or leisure. We speak of the aristocracy as we

speak of the élite and the four hundred or we follow Marx and Engels in thinking of the feudal aristocracy as the class that was ruined by the bourgeoisie. The *Communist Manifesto* wastes little sympathy on the aristocrats who while seeking an ally in the proletariat forgot that they [too] exploited under circumstances and conditions that were quite different. For Marx and Engels the aristocracy and the bourgeoisie alike represent the propertied classes but they differ in the manner in which they came by their property and power. The landed gentry and the feudal nobility got theirs largely by inheritance; the bourgeoisie by industry and trade.

Today for the most part we call a man an aristocrat if justly or unjustly he claims a right to certain social distinctions or privileges. We seldom use that word today to indicate a man who deserves special political status or pre-eminence though we do sometimes use it to name the proponent of any form of government which rests upon the political inequality of men.

Since the discussion of aristocracy in the great books is largely political we shall here be primarily concerned with aristocracy as a form of government. The general consideration of the forms of government will be found in the chapter on GOVERNMENT. Here and in the other chapters which are devoted to particular forms of government we shall consider each of the several forms both in itself and in relation to the others.

THERE IS ONE element in the conception of aristocracy which does not change with changing evaluations of aristocratic government. All of the writers of the great political books agree with Plato that aristocracy is a government of the few according as the few rather than

the one or the many exercise political power and dominate the state. By this criterion of number aristocracy is always differentiated from monarchy and democracy.

Though he uses the word oligarchy to name what others call aristocracy, Locke defines the three forms of government by reference to numbers. When the majority themselves exercise the whole power of the community, Locke says, then the form of the government is a perfect democracy. When they put "the power of making laws into the hands of a few select men" then it is an oligarchy; or else into the hands of one man, and then it is a monarchy." Kant proceeds similarly though in somewhat different language. The relation of the supreme power to the people he says, is conceivable in three different forms either in the state rules over all or "one man" in relation of equality with each other and over all the others or "all together rule over each individual including themselves. The form of the state is therefore either *aristocracy* or *monarchy* or *democracy*.

Hevel claims however that purely quantitative distinction like these are only superficial and do not afford the concept of the other. The criterion of number does not seem to suffice when other forms of government are considered. It fails to distinguish monarchy from tyranny or despotism which may consist of rule by one man, as has usually been the case historically. Number alone likewise fails to distinguish aristocracy from oligarchy. In the deliberations of the Medean conspirators, which Herodotus report is in truth, the rule of a certain number of the worthies is set against both democracy and monarch and denoted as "oligarchy." How then shall aristocracy be distinguished from oligarchy?

There seem to be two answers to this question. In the *Socratean* Plato adds to the characteristic of number the "criterion of law and the absence of law." The bad is of political power whatever their number may govern either according to the established laws, or by arbitrary caprice in violation of them. "To go against the laws, which are based upon long experience and the wisdom of counsellors who have graciously recommended them and persuaded the multitude to pass them, would be"

the Eleatic Stranger declares in the *Socratean* "a far greater and more ruinous error than any adherence to written law."

Taking the division of governments according to number "the principle of law and the absence of law will bisect them all." Monarchy divides into royalty and tyranny depending on whether an individual rules according to law or governs neither by law nor by custom, but pretends that he can only act for the best by violating the laws, while in reality appetite and ignorance are the motives." By the same criterion the rule of the few divides into aristocracy which has an auspicious name and oligarchy." While democracy is subject to the same division, Plato makes the same name apply to both its good and bad forms.

The second way in which aristocracy differs from oligarchy is also brought out in the *Socratean*. Since "the science of government" according to Plato is "among the greatest of all sciences and most difficult to acquire" any true form of government can only be supposed to be the government of one two or at any rate of a few "really found to possess science." Because of this demand for "science" which presupposes virtue and competence in ruling monarch and aristocracy came to be defined as government by the *united* best man or by the *few* best men in the community.

A high degree of competence or virtue is, however not the only mark by which the few may be distinguished from the many. The possession of wealth or property in any sizeable amount also seems to divide a small class in the community from the rest and Plato at times refers to aristocracy simply as the government of the rich. Yet if wealth is the criterion by which the few are chosen to govern, then oligarchy results, at least in contrast to that sense of aristocracy in which the criterion is excellence of mind and character. Aristocracy is called aristocracy writes Aristotle "either because the rulers are the best men, or because they have at heart the best interests of the state and of the citizens."

By these additional criteria—neither numbers alone—the ancients conceive an aristocracy. When it is so defined it always appears to be a good form of government but never the only good form or even the best. The same

criteria also place monarchy among the good forms and—at least in Plato's *Statesman*—democracy is a third good form when it is lawful government by the many the many being competent or virtuous to some degree. In this triad of good forms aristocracy ranks second best because government by one man is supposed to be more efficient or because in the hierarchy of excellence the few may be superior but only the one can be supreme. Aristotle however seems to rank aristocracy above monarchy.

If we call the rule of many men who are all of them good aristocracy and the rule of one man royalty he writes then aristocracy will be better for states than royalty.

The introduction of democracy into the comparison tends to complicate the discussion. Not only are the many usually the poor but they are also seldom considered pre eminent in virtue or competence. According to the way in which either wealth or human excellence is distributed both oligarchy and aristocracy organize the political community in terms of inequalities in status power and privilege. This fact leads Rousseau for example to use the different kinds of inequality among men as a basis for distinguishing three sorts of aristocracy—natural elective and hereditary.

Natural aristocracy according to Rousseau is based on that inequality among men which is due primarily to age and is found among simple peoples where the young bowed without question to the authority of experience. Elective aristocracy arose in proportion as artificial inequality produced by institutions became predominant over natural inequality and riches or power were put before age. This form in Rousseau's opinion is the best and is aristocracy properly so called. The third which is characterized as the worst of all governments came about when the transmission of the father's power along with his goods to his children by creating patrician families made government hereditary.

This emphasis upon inequality radically separates aristocracy from democracy. From Aristotle down to Montesquieu Rousseau and our own day equality has been recognized as the distinctive element of democracy. Disregarding slaves who for the ancients were political

priests Aristotle makes liberty the other mark of democracy—all freemen having apart from wealth or virtue an equal claim to political status. As the principle of an aristocracy is virtue Aristotle writes so wealth is the principle of an oligarchy and freedom of a democracy.

To the defenders of democracy ancient or modern aristocracy and oligarchy stand together at least negatively in their denial of the principle of equality. To the defenders of aristocracy oligarchy is as far removed as democracy since both oligarchy and democracy neglect or underestimate the importance of virtue in organizing the state. Yet oligarchy more than democracy is the characteristic perversion of aristocracy. It also puts government in the hands of the few but it substitutes wealth for virtue as the criterion. The democratic critic of aristocracy usually calls attention to the way in which oligarchy tries to wear the mask of aristocracy. However far apart aristocracy and oligarchy may be in definition he insists that in actual practice they tend to become identical in proportion as wealth or noble birth or social class is taken as the sign of intrinsic qualities which are thought to deserve special political recognition.

The defenders of aristocracy have admitted the tendency of aristocratic government to degenerate into oligarchy. Its critics are not satisfied with this admission. They deny that aristocracy has ever existed in purity of principle—they deny that the governing few have ever been chosen solely for their virtue. Machiavelli assumes it to be a generally accepted fact that the nobles wish to rule and oppress the people

and give vent to their ambitions. Montesquieu although more optimistic about the possibility of a truly virtuous aristocracy recognizes its tendency to profit at the expense of the people. To overcome this he would have the laws make it an essential point that the nobles themselves should not levy the taxes and should likewise forbid the nobles all kinds of commerce and abolish the right of primogeniture among the nobles to the end that by a continual division of the inheritances their fortunes may be always upon a level.

But perhaps the strongest attack upon aristocracy in all of the great political books is

made by Mill in his *Repre en ative Government*: He admits that the governments which have been remarkable in history for sustained mental ability and vigour in the conduct of affairs have generally been aristocracies. But he claims that whatever their abilities such governments were essentially bureaucracies and the dignity and estimation of their rulers, members were quite different things from the prosperity or happiness of the general body of the citizens and were often wholly incompatible with it. When their actions are dictated by sinister interests as frequently happens the aristocratic class assumes to themselves an endless variety of unjust privileges sometimes benefiting their pockets at the expense of the people sometimes merely tending to exalt them above others or what is the same thing in different words to degrade others below themselves.

Yet except by those political thinkers who deny the distinction between good and bad government and hence the relevance of virtue to institutions which are solely expressions of power the aristocratic principle is seldom entirely rejected. Even then the notion of a pure aristocracy is dismissed as an ideal which can never be fully realized the aristocratic principle reappears as a counsel of perfection in the improvement of other forms of government.

Even so one difficulty remains who tends to prefer an aristocracy from being realized in practice quite apart from any question of its soundness in principle. It lies in the reluctance of the best men to assume the burdens of public office. The parable told in the Book of Judges applies to aristocracy as much as to monarchy.

The trees went forth in time to an old king and said unto the olive tree: Reign thou over us.

Beth I, the tree said unto them: Should I leave my sweet fruit which they have no God and man among to be promoted over the trees?

And the trees said the fig tree: Come thou and reign over us.

Beth I said to them: Should I forsake my sweet fruit and my good fragrance to be promoted over the trees?

Then said the trees unto the vine: Come thou and reign over us.

And the vine said unto them: Should I leave my sweet fruit which God and man have no God and man among to be promoted over the trees?

Then said all the trees unto the bramble: Come thou and reign over us.

And the bramble said unto the trees: If in truth ye are not fit to reign over you then come and put your trust in my shadow and if not let fire come out of the bramble and devour the cedars of Lebanon.

Socrates thinks he has a solution for this problem. In the *Republic* he proposes a new way to induce good men to rule. Since money and honor have no attraction for them necessity Socrates says must be laid upon them and they must be induced to serve from fear of punishment. Now the worst part of the punishment is that he who refuses to rule is liable to be ruled by one who is worse than himself. And the fear of this as I conceive induces the good to take office not under the idea that they are going to have any benefit or enjoyment themselves but as a necessity and because they are not able to commit the task of ruling to anyone who is better than themselves or indeed as good.

THE POLITICAL ISSUES in which monarchy aristocracy or garchy and democracy represent the major alternatives cannot be clarified without recourse to the distinction between government by laws and government by men.

It has already been noted that in the *Statesman* Plato makes respect for the laws and violation of the laws the marks of good and bad government respectively. But he also proposes that the best thing of all is not that the law should rule but that a man should rule supposing him to have wisdom and royal power. The imperfection of law could then be avoided because one or a few men of almost superhuman wisdom would govern their inferiors even a the gods could direct the affairs of men without the aid of established laws. But if no man is a god in relation to other men then in Plato's opinion it is better for laws or customs to be supreme and for men to rule in accordance with them.

The larger issue concerning rule by laws and rule by men is discussed in the chapters on CONSTITUTION and MONARCHY. But here we must observe how the difference between the two types of rule affects the understanding of all other forms of government. This can be seen in terms of Aristotle's distinction between royal

criteria also place monarchy among the good forms and—at least in Plato's *Statesman*—democracy is a third good form when it is lawful government by the many the many being competent or virtuous to some degree. In this triad of good forms aristocracy ranks second best because government by one man is supposed to be more efficient or because in the hierarchy of excellence the few may be superior but only the one can be supreme. Aristotle however seems to rank aristocracy above monarchy.

If we call the rule of many men who are all of them good aristocracy and the rule of one man royalty he writes then aristocracy will be better for states than royalty.

THE INTRODUCTION of democracy into the comparison tends to complicate the discussion. Not only are the many usually the poor but they are also seldom considered pre eminent in virtue or competence. According to the way in which either wealth or human excellence is distributed both oligarchy and aristocracy organize the political community in terms of inequalities in status power and privilege. This fact leads Rousseau for example to use the different kinds of inequality among men as a basis for distinguishing three sorts of aristocracy—natural elective and hereditary.

Natural aristocracy according to Rousseau is based on that inequality among men which is due primarily to age and is found among simple peoples where the young bowed without question to the authority of experience. Elective aristocracy arose in proportion as artificial inequality produced by institutions became predominant over natural inequality and riches or power were put before age. This form in Rousseau's opinion is the best and is aristocracy properly so called. The third which is characterized as the worst of all governments came about when the transmission of the father's power along with his goods to his children by creating patrician families made government hereditary.

This emphasis upon inequality radically separates aristocracy from democracy. From Aristotle down to Montesquieu Rousseau and our own day equality has been recognized as the distinctive element of democracy. Disregarding slaves who for the ancients were political

pariahs Aristotle makes liberty the other mark of democracy—all freemen having apart from wealth or virtue an equal claim to political status. As the principle of an aristocracy is virtue Aristotle writes so wealth is the principle of an oligarchy and freedom of a democracy.

To the defenders of democracy ancient or modern aristocracy and oligarchy stand together at least negatively in their denial of the principle of equality. To the defenders of aristocracy oligarchy is as far removed as democracy since both oligarchy and democracy neglect or underestimate the importance of virtue in organizing the state. Yet oligarchy more than democracy is the characteristic perversion of aristocracy. It also puts government in the hands of the few but it substitutes wealth for virtue as the criterion. The democratic critic of aristocracy usually calls attention to the way in which oligarchy tries to wear the mask of aristocracy. However far apart aristocracy and oligarchy may be in definition he insists that in actual practice they tend to become identical in proportion as wealth or noble birth or social class is taken as the sign of intrinsic qualities which are thought to deserve special political recognition.

The defenders of aristocracy have admitted the tendency of aristocratic government to degenerate into oligarchy. Its critics are not satisfied with this admission. They deny that aristocracy has ever existed in purity of principle—they deny that the governing few have ever been chosen solely for their virtue. Machiavelli assumes it to be a generally accepted fact that the nobles wish to rule and oppress the people

and give vent to their ambitions. Montesquieu although more optimistic about the possibility of a truly virtuous aristocracy recognizes its tendency to profit at the expense of the people. To overcome this he would have the law make it an essential point that the nobles themselves should not levy the taxes

and should likewise forbid the nobles all kinds of commerce and abolish the right of primogeniture among the nobles to the end that by a continual division of the inheritances their fortunes may be always upon a level.

But perhaps the strongest attack upon aristocracy in all of the great political books is

era of aristocracy as a distinct form of government is largely superseded by the consideration of the role which the aristocratic principle plays in the development of republican institutions.

The writers of *The Federalist*, for example, referred in several places to the charge that the excess too which they had defending shows tendencies toward aristocracy or oligarchy. Let us then reconsideration and defense of the new instrument of government as this... with regard to this, they frequently agreed to principles that are aristocratic in nature.

In favor their own measures to the "new republic" and "pure democracy"—that is, government by elected representatives on the one hand, and by the direct participation of the whole people on the other—the Federalists also gave an alternative bent to the very notion of representation. They seem to share the opinion of Macaulay that "as most citizens have sufficient ability to choose, those who are qualified to be chosen, so the people though capable of all, others to account for their administration, are incapable of conducting administrations themselves."

Thus Madison praises the delegation of the government to a small number of citizens chosen by the rest as "nothing to refine and exalt the public views, by passing them through the medium of a chosen body of citizens, whose wisdom can best discern the true interest of their country. He further points out that "it may well happen that the public are pronounced by the representatives of the people will be more consonant to the public good than if pronounced by the people themselves con tended for the purpose."

On such a view the people's representatives in the legislature, or other branches of government are supposed to be not their masters, but their betters. For the American case, aristocrats, as for Edmund Burke the representative is to serve his constituents by making independent decisions for the common good, not by doing their bidding. This theory of representation, to which Mill and other democratic thinkers are in part supposes that the representative knows better than his constituents what is for their good.

The effort to ensure leadership by superior men may involve the aristocratic principle, yet

it is also claimed by Hamilton, Madison, and Jay to be a necessary safeguard for popular government. The senate, for instance, is not only to provide elder statesmen, but is also to serve as a salutary check on the government (which) doubles the security to the people by requiring the concurrence of two distinct bodies in schemes of usurpation or perfidy where the ambition or corruption of one would otherwise be sufficient. The electoral college aims directly at placing the immediate election of the president in the hands of "men most capable of analysis, the qualities adapted to the situation under circumstances favorable to democracy." In addition it may serve as an "elitist" opposed to cabal, faction and corruption, which are the "most deadly adversaries of republican government."

In all these respects, as well as in the restrictions on suffrage which it permitted the states to impose the unamended American constitution appears to have adopted an aristocratic principle in government. Whether the motivation of its proponents was in fact simple aristocracy, or whether it was partly or even largely of "ethical-leadership" being the right of men of "good" family and substantial property—will always be a question to be decided in the light of the documents and the relevant historic evidence.

More democratic than the American constitutions of the 18th century, certainly so with regard to the extension of suffrage, John Stuart Mill appears to be no less concerned than they are to introduce aristocratic elements into the structure of representative government.

According to Mill, two grave dangers confront a democratic "Danger of a low grade of intelligence in the representative body, and in the popular opinion which controls it, and danger of class legislation on the part of the numerical majority." Claiming that much of the blame for both dangers lies in the rule of the majority, Mill looks for means to a regime the situation in which "the numerical majority alone possess practically any voice in the State."

His major remedy was a system of proportional representation. This would supposedly

and political government which closely resembles the modern conception of the difference between absolute or despotic government on the one hand and limited constitutional, or republican government on the other.

There are passages in which Aristotle regards absolute rule by one or a few superior men as the divine or godlike form of government. When one man or a few excel all the others together in virtue and both rulers and subjects are fitted the one to rule the others to be ruled it is right in Aristotle's opinion for the government to be royal or absolute rather than political or constitutional—whether one man rules or a few. Royal rule is of the nature of an aristocracy he says. It is based upon merit whether of the individual or of his family.

But in other passages Aristotle seems to regard absolute government as a despotic regime appropriate to the family and the primitive tribe but not to the state in which it is better for equals to rule and be ruled in turn. In either case it makes a difference to the meaning of aristocracy as also to monarchy whether it be conceived as absolute or constitutional government.

When it is conceived as absolute government aristocracy differs from monarchy only on the point of numbers—the few as opposed to the one. Otherwise aristocracy and monarchy are defended in the same way. The defense usually takes one of two directions. One line of argument which stems from Plato and Aristotle claims that inequality in wisdom or virtue between ruler and ruled justifies absolute rule by the superior. The other line is followed by those who like Hobbes maintain that since sovereignty is absolute, unlimited, and indivisible the difference between kinds of government consisteth not in the difference of power but in the difference of convenience or aptitude to produce the peace and security of the people. When they are conceived as forms of absolute government aristocracy and monarchy are attacked for the same reason to those who regard absolutism or despotism in government as unjust because it violates the basic equality of men an absolute monarchy and a despotic aristocracy are both unjust.

Aristocracy however can also be conceived as a form or aspect of constitutional govern-

ment Montesquieu for example divides governments into republican monarchical and despotic and under republican places those in which the body or only a part of the people is possessed of the supreme power thus including both democracy and aristocracy. In both laws not men are supreme but the spirit of the laws is different. In democracy the spring or principle by which it is made to act is virtue resting on equality in aristocracy 'moderation is the very soul' a moderation founded on virtue not that which proceeds from indolence and pusillanimity Hegel's comment on this theory deserves mention. The fact that moderation is cited as the principle of aristocracy he writes implies the beginning at this point of a divorce between public authority and private interest.

For Aristotle, in contrast to Montesquieu the two major types of constitution are the democratic and the oligarchical according as free birth or wealth is made the chief qualification for citizenship and public office. Aristocracy enters the discussion of constitutional governments mainly in connection with the construction of the polity or mixed constitution. Although in most states the fusion goes no further than the attempt to unite the freedom of the poor and the wealth of the rich he points out that there are three grounds on which men claim an equal share in the government freedom wealth and virtue.

When the fusion goes no further than the attempt to unite the freedom of the poor and the wealth of the rich the admixture of the two elements Aristotle says is to be called a polity. But sometimes the mixture of democracy with oligarchy may include an ingredient of aristocracy as in the distribution of offices according to merit. The union of these three elements is to be called aristocracy or the government of the best and more than any other form of government except the true and the ideal it has in Aristotle's judgment a right to this name. Polity and aristocracy are mixed constitutions are fusions of some of the same elements hence he says it is obvious that they are not very unlike.

BEGINNING IN THE 18TH CENTURY AND WITH THE RISE OF REPRESENTATIVE GOVERNMENT THE DISCUSSION

very prof is government by the one or few who are eminent in wisdom or virtue. Es h ad-  
perior, con nates only part of the truth.  
Certainly those who acknowledge a political  
wisdom in the prepoond-rant voice of the many  
but who also recog-nise another wisdom in the  
killed judgment of the few cannot wish to ex-  
clude either from exerting its due influence  
upon the course of government.

"All also her issue has to do with education,  
Shall educational opportunity be as uni- versal  
as the franchise? Shall those whose native en-  
dowments fit them for political leadership be  
trained differently or more extensively than  
their fellow citizens? Shall vocational educa-  
tion be given to the many and liberal educa-  
tion be reserved for the few?

These questions pround some measure of the  
extent to which anyone's thinking is an ar-  
istocrat or democrat—or involves some admix-  
ture of both strains. In the great discussion of  
these questions and issues, there is one even

present ambiguity. We have already noted it in  
considering the reality of the line between aris-  
tocracy and oligarchy. The agreement or dis-  
agreement of Mill and Aristotle, of Burke and  
Plato, of Hamilton and Parte, of Leibniz and  
Parte, or John Dewey and Matthew Arnold  
cannot be judged without it in view whether  
the distinction between the many and the few  
derives from nature or convention.

It is this distinction which Jefferson had in  
mind when, writing to Adams in 1813, he said  
"There is a natural aristocracy among men.  
The grounds of this are virtue and talents.  
There is also an artificial aristocracy founded on  
wealth and birth without either virtue or talen-  
ts; for with these it would belong to the first  
class. The natural aristocracy I consider as the  
most precious gift of nature for the instruc-  
tion the trusts, the government of society.  
The artificial aristocracy is a mischievous in-  
gredient in government and pro vision should  
be made to prevent its ascendancy."

## OUTLINE OF TOPICS

1. The general theory and evaluation of aristocracy	AGR
1a. Aristocracy as a good form of government	53
1b. Criticisms of aristocracy as unrealizable or unjust	59

6. The selection of the best men for public office: the aristocratic theory of representation in modern constitutional government	
— Historic and poetic exemplifications of aristocracy	62

constitute a democratic improvement by securing representation for every minority in the whole nation on principles of equal justice. But it may also serve to increase an aristocratic element since it affords the best security for the intellectual qualifications desirable in the representatives. This would be brought about by making possible the election of hundreds of able men of independent thought who would have no chance whatever of being chosen by the majority with the result that Parliament would contain the 'very élite of the country.'

To make still more certain that men of superior political intelligence exert an effect upon government Mill also proposes a plurality of votes for the educated and the establishment of an upper legislative chamber based on a specially qualified membership. Such proposals seem to indicate Mill's leanings toward aristocracy not only because they aim at procuring a government of the best but also because they are designed to prevent a government based on a majority of manual labourers with the consequent danger of too low a standard of political intelligence.

THE ISSUES RAISED by the theory of aristocracy or by the aristocratic principle in government seem to be basically the same in all centuries however different the terms or the context in which they are expressed. Even when as today a purely aristocratic form of government does not present a genuine political alternative to peoples who have espoused democracy there remains the sense that pure or unqualified democracy is an equally undesirable extreme. The qualifications proposed usually add an aristocratic taint.

One issue concerns the equality and inequality of men. The affirmation that all men are created equal does not exclude a recognition of their individual inequalities—the wide diversity of human talents and the uneven distribution of intelligence and other abilities. Nor does it mean that all men use their native endowments to good purpose or in the same degree to acquire skill or knowledge or virtue.

To grasp the double truth—that no man is essentially more human than another though one may have more of certain human abilities

than another—is to see some necessity for the admixture of democratic and aristocratic principles in constructing a political constitution. But the issue is whether distributive justice requires as a matter of right that the best men should rule or hold public office.

Some political philosophers like Plato and Aristotle tend to take the aristocratic view that men of superior ability have a right to govern—that for them to be ruled by their inferiors would be unjust. This theory places greater emphasis on the inequality than on the equality of men. Their democratic opponents insist that the equality of men *as men* is the fundamental fact and the only fact having a bearing on the just distribution of suffrage. That certain individuals have superior aptitude for the exercise of political authority does not automatically confer that authority upon them. The inequality of men in merit or talent does not establish a political right as does their equality in human nature. The selection of the best men for public office is on this theory not a matter of justice but of expediency or prudence.

Another issue concerns the weight to be given the opinion of the majority as against the opinion of the wise or the expert when as frequently happens these opinions diverge or conflict. As the chapter on OPINION indicates, the experts themselves disagree about the soundness of the popular judgment.

Where Thucydides believes that ordinary men usually manage public affairs better than their more gifted fellows because the latter are always wanting to appear wiser than the laws Herodotus observes that it seems easier to deceive the multitude than one man. Where Hegel holds it to be a dangerous and a false prejudice that the People alone have reason and insight and know what justice is John Jay declares that the people of any country (if like the Americans intelligent and well informed) seldom adopt and steadily persevere for many years in an erroneous opinion respecting their interests and Hamilton adds that the people commonly intend the public good.

Sometimes the same author seems to take both sides of the issue as Aristotle does when though he says that a multitude is a better judge of many things than any individual he

## Chapter 4 ART

### INTRODUCTION

THE word art has a range of meanings which may be obscured by the current disposition to use the word in an extremely restricted sense. In contemporary thought art is most readily associated with beauty, yet its historic connections with utility and knowledge are probably more intimate and pervasive.

The prevalent popular association reflects a tendency in the 19th century to annex the theory of art to aesthetics. This naturally led to the identification of art with one kind of art—the so called fine arts—beaux arts or Schone Kunste (arts of the beautiful). The contraction of meaning has gone so far that the word art sometimes signifies one group of the fine arts—painting and sculpture—as in the common phrase literature music and the fine arts. This restricted usage has become so customary that we ordinarily refer to a museum of art or to an art exhibit in a manner which seems to assume that the word art is exclusively the name for something which can be hung on a wall or placed on a pedestal.

A moment's thought will of course correct the assumption. We are not unfamiliar with the conception of medicine and teaching as arts. We are acquainted with such phrases as the industrial arts and arts and crafts in which the reference is to the production of useful things. Our discussions of liberal education should require us to consider the liberal arts which however defined or enumerated are supposed to constitute skills of mind. We recognize that art is the root of artisan as well as artist. We thus discern the presence of skill in even the lowest forms of productive labor. Seeing it also as the root of artifice and artificial we realize that art is distinguished from and sometimes even opposed to nature.

The ancient and traditional meanings are all present in our daily vocabulary. In our thought the first connotation of art is fine art in the thought of all previous eras the useful arts came first. As late as the end of the 18th century Adam Smith follows the traditional usage which begins with Plato when in referring to the production of a woolen coat he says: The shepherd the sorter of the wool the wool comber or carder the dyer the scribbler the spinner the weaver the fuller the dresser with many others must all join their different arts in order to complete even this homely production.

In the first great conversation on art—that presented in the Platonic dialogues—we find useful techniques and everyday skills typifying art by reference to which all other skills are analyzed. Even when Socrates analyzes the art of the rhetorician as in the *Gorgias* he constantly turns to the productions of the cobbler and the weaver and to the procedures of the husbandman and the physician. If the liberal arts are praised as highest because the logician or rhetorician works in the medium of the soul rather than in matter they are called arts only in a manner of speaking and by comparison with the fundamental arts which handle physical material.

The Promethean gift of fire to men which raised them from a brutish existence earned with it various techniques for mastering matter—the basic useful arts. Lucretius writing in a line that goes from Homer through Thucydides and Plato to Bacon Adam Smith and Rousseau attributes the progress of civilization and the difference between civilized and primitive society to the development of the arts and sciences. Ships and tillage walls laws roads dress and all such like things all the prizes all the elegancies too of life without

exception, poems, pictures, and the chiseling of fine-wrought statues, all these things practiced together with the acquired knowledge of the untiring mind taught men by slow degrees as they advanced on the way step by step."

At the beginning of this progress Lucretius places man's discovery of the arts of metal working, domesticating animals, and cultivating the soil. "Metallurgy and agriculture" says Rousseau, "were the two arts which produced this great revolution"—the advance from primitive to civilized life. The fine arts and the speculative sciences come last, not first in the progress of civilization.

The fine arts and the speculative sciences come last in human life. They are not necessary—except perhaps for the good life. They are the dedication of human leisure and its best fruit. The leisure without which they neither could come into being nor prosper is found for man and fostered by the work of the useful arts. Aristotle tells us that is "why the mathematical arts were founded in Egypt for were the priestly caste was allowed to be at leisure."

THERE IS ANOTHER ambiguity in the reference of the word "art." Sometimes we use it to name the effects produced by human workmanship. We elliptically refer to *works of art* as art. Sometimes we use it to signify the cause of the things produced by human work—that skill of mind which directs the hand in its manipulation of material. Art is both in the artist and in the work of art—in the one as cause in the other as the effect. That is effected is a certain ennoblement of matter, a transformation produced not merely by the hand of man, but by his thought or knowledge.

The more generic meaning of art seems to be that of art as cause rather than as effect. There are many spheres of art in which no tangible product results, as in navigation or military strategy. We might of course, call a shipfall or a victory a work of art, but we are liable to speak of the art of the navigator or the general. So, too, in medicine and teaching, we look upon the health or knowledge which results from healing or teaching as natural. We do not find art in them, but rather in the skill of the healer or teacher who has helped

to produce that result. Hence even in the case of the shoe or the statue art seems to be primarily in the mind and work of the cobbler or sculptor and only derivatively in the objects produced.

Aristotle in defining art as a capacity to make up giving a true course of reasoning, identifies it with making as distinct from doing and knowing. Though art like science and moral action, belongs to the mind and involves experience and learning, imagination and thought, it is distinct from both in aiming at production in being, knowledge, of how to make something or to obtain a desired effect. Science on the other hand is knowledge that something is the case, or that a thing has a certain nature. Knowledge is sometimes identified with science, to the exclusion of art or skill, but we depart from this narrow notion whenever we recognize that skill consists in *knowing how to make something*.

"Even in speculative matters," writes Aquinas, "there is something by way of work, e.g. the making of a syllogism, or a fitting speech or the work of counting or measuring. Hence whatever habits are ordained to suchlike works of the speculative reason are by a kind of comparison called arts indeed but *liberal arts*, in order to distinguish them from those arts which are ordained to works done by the body, which arts are in a fashion servile, inasmuch as the body is in servile subjection to the soul, and man as regards his soul is free. On the other hand, those sciences which are not ordained to any suchlike work, are called sciences simply and not arts."

The discussion of medicine in the great books throws light on the relation of art and science in their origin as well as their development. Hippocrates writes of medicine as both an art and a science. In his treatise on *Locum Medicinae* he says: "It appears to me necessary to every physician to be skilled in nature and science to know—if he would wish to perform his duties—what man is in relation to the articles of food and drink, and to his other occupations, and what are the effects of each of them on every one. And it is not enough to know simply that cheese is a bad article of food, as disagreeing with whoever eats of it to satiety but what sort of disturbance it creates, and therefore

and with what principle in man it disagrees. Whoever does not know what effect these things produce upon a man cannot know the consequences which result from them nor how to apply them. As a science medicine involves knowledge of the causes of disease, the different kinds of diseases and their characteristic courses. Without such knowledge diagnosis, prognosis and therapy would be a matter of guesswork—of chance as Hippocrates says—or at best the application of rule-of-thumb in the light of past experience.

But the scientific knowledge does not by itself make a man a healer, a practitioner of medicine. The practice of medicine requires art in addition to science—art based on science but going beyond science in formulating general rules for the guidance of practice in particular cases. The habit of proceeding according to rules derived from science distinguishes for Galen the artist in medicine from the mere empiric. The antithesis of artist and empiric—suggesting the contrast between operation by tested rule and operation by trial and error—parallels the antithesis between scientist and man of opinion.

IT HAS SELDOM if ever been suggested that an art can be originally discovered or developed apart from some science of the subject matter with which the art deals. This does not mean that an individual cannot acquire the habit of an art without being taught the relevant scientific knowledge. An art can be learned by practice; skill can be formed by repeated acts. But the teacher of an art cannot direct the learning without setting rules for his pupils to follow and if the truth or intelligibility of the rules is questioned the answers will come from the science underlying the art.

According to Kant every art presupposes rules which are laid down as the foundation which first enables a product if it is to be called one of art to be represented as possible. In the case of fine art which he distinguishes from other kinds of art as being the product of genius Kant claims that it arises only from a talent for producing that for which no definite rule can be given. Yet he maintains that a rule is still at its basis and may be gathered from the performance *i.e.* from the product

which others may use to put their own talent to the test.

Granting that there is no art without science is the reverse true and is science possible without art? The question has two meanings. First are there arts peculiarly indispensable to the development of science? Second does every science generate a correlative art and through it work productively?

Traditionally the liberal arts have been considered indispensable to science. This has been held to be particularly true of logic. Because they were intended to serve as the instrument or the art for all the sciences Aristotle's logical treatises which constitute the first systematic treatment of the subject deserve the title *Organon* which they traditionally carry. Bacon's *Novum Organum* was in one sense an effort to supply a new logic or art for science and to institute a renovation of the sciences by the experimental method.

As an art logic consists of rules for the conduct of the mind in the processes of inquiry, inference, definition and demonstration by which sciences are constructed. Scientific method is in short the art of getting scientific knowledge. In the experimental sciences there are auxiliary arts—arts controlling the instruments or apparatus employed in experimentation. The experiment itself is a work of art combining many techniques and using many products of art—the water clock, the inclined plane and the pendulum of Galileo, the prisms, mirrors and lenses of Newton.

The second question—whether all sciences have related arts and through them productive power—raises one of the great issues about the nature of scientific knowledge discussed in the chapters on PHILOSOPHY and SCIENCE.

For Francis Bacon and to some extent Descartes art is the necessary consequence of science. At the beginning of the *Novum Organum* Bacon declares that knowledge and human power are synonymous since the ignorance of the cause frustrates the effect for nature is only subdued by submission and that which in contemplative philosophy corresponds with the cause in practical science becomes the rule. The distinction Bacon makes here between the speculative and practical parts of knowledge corresponds to the distinction between science

and art or as we sometimes say pure and applied science. He opposes their divorce from one another. If science is the indispensable foundation of art and consists in a knowledge of causes art in Bacon's view is the whole fruit of science, for it applies that knowledge to the production of effects.

His theory of science and his new method for its development are directed to the establishment of man's empire over creation which is founded on the arts and sciences alone. Just as the present state of the arts accounts for the immense difference between men's lives in the most polished countries of Europe and in any wild and barbarous region of the new Indies so further advances in science promise the untold power of new inventions and techniques.

On Bacon's view not only the value but even the validity of scientific knowledge is to be measured by its productivity. A useless natural science—a science of nature which cannot be used to control nature—is unthinkable. With the exception of mathematics every science has its appropriate magic or special productive power. Even metaphysics in Bacon's conception of it has its true natural magic, such as that great liberty and latitude of operation which dependeth upon the knowledge of forms.

The opposite answer to the question about science and art is given by Plato, Aristotle, and others who distinguish between speculative and productive sciences. They differ from Bacon on the verbal level by using the word practical for those sciences which concern moral and political action rather than the production of effects. The sciences Bacon calls practical they call productive but under either name these are the sciences of making rather than doing—sciences which belong in the sphere of art rather than prudence. But the significant difference lies in the evaluation of the purely speculative sciences which consist in knowledge for its own sake distinct from art and morals or from the utilities of production and the necessities of action.

In tracing the history of the sciences, Aristotle notes that those men who first found the useful arts were thought wise and superior. But as more arts were invented and some were

directed to the necessities of life others to recreation the inventors of the latter were naturally also regarded as wiser than the inventors of the former because their branches did not aim at utility. Hence when all such inventions were already established the sciences which do not aim at giving pleasure or at the necessities of life were discovered and first in the places where men first began to have leisure. So that the man of experience is thought to be wiser than the possessors of any sense-perception whatever the artist wiser than the man of experience the master worker than the mechanic and the theoretical kinds of knowledge to be more of the nature of Wisdom than the productive. That the theoretic sciences are useless in the sense of not providing men with the necessities or pleasures of life is a mark of their superiority. They give what is better than such utility—the insight and understanding which constitute wisdom.

The Baconian reply condemns the conception that there can be knowledge which is merely contemplation of the truth. It announces the revolution which for John Dewey ushered in the modern world. The pragmatic theory of knowledge had its origin in a conception of science at every point fused with art.

THE ANCIENTS trying to understand the natural phenomena of change and generation found that the processes of artistic production provided them with an analytic model. Through understanding how he himself worked in making things man might come to know how nature worked.

When a man makes a house or a statue he transforms matter. Changes in shape and position occur. The plan or idea in the artist's mind comes through his manipulation of matter to be embodied and realized objectively. To the ancients a number of different causes or factors seemed to be involved in every artistic production—material to be worked on, the activity of the artist at work, the form in his mind which he sought to impose on the matter thus transforming it, and the purpose which motivated his effort.

In the medical tradition from Aristotle through Galen to Harvey there is constant emphasis upon the artistic activity of nature.

Galen continually argues against those who do not conceive Nature as an artist. Harvey consciously compares the activity of nature in biological generation to that of an artist. Like a potter she first divides her material and then indicates the head and trunk and extremities like a painter she first sketches the parts in outline and then fills them in with colours or like the ship builder who first lays down his keel by way of foundation and upon this raises the ribs and roof or deck even as he builds his vessel does nature fashion the trunk of the body and add the extremities.

Of all natural changes the one most closely resembling artistic production appears to be generation especially the production of living things by living things. In both cases a new individual seems to come into being. But upon further examination artistic production and natural generation reveal significant differences—differences which divide nature from art.

Aquinas considers both and distinguishes them in his analysis of divine causation. In things not generated by chance he points out that there are two different ways in which the form that is in the agent is passed on to another being. In some agents the form of the thing to be made pre exists according to its natural being as in those that act by their nature as a man generates a man or fire generates fire. Whereas in other agents the form of the thing to be made pre exists according to intelligible being as in those that act by the intellect and thus the likeness of a house pre exists in the mind of the builder. And this may be called the idea of the house since the builder intends to build his house like to the form conceived in his mind.

Thus in biological procreation the progeny have the form of their parents—a rabbit producing a rabbit a horse a horse. Put in artistic production the product has not the form of the artist but the form he has conceived in his mind and which he seeks to objectify. Furthermore in generation and in other natural changes as well the matter which undergoes change seems to have in itself a tendency to become what it changes into as for example the acorn naturally tends to become an oak whereas the oaken wood does not have in itself any tendency to become a chair or a bed. The material the

artist works on is entirely passive with respect to the change he wishes to produce. The artist's result is in this sense entirely of his making.

The realm of art or of the artificial is the opposed to the natural and differentiated from it. Kant for whom art is distinguished from nature as making is from acting or operating in general claims that by right it is only production through freedom i.e. through an act of will that places reason at the basis of its action that should be termed art. Consequently art is that which would not have come into being without human intervention. The man made object is produced by man not in any way but specifically by his intelligence by the reason which makes him free.

Animals other than man are apparently productive but the question is whether they can be called artists. A spider conducts operations that resemble those of a weaver and a bee puts to shame many an architect in the construction of her cells. But according to Marx what distinguishes the worst architect from the best of bees is this that the architect raises his structure in imagination before he erects it in reality. At the end of every labour process we get a result that already existed in the imagination of the labourer at its commencement. He not only effects a change of form in the material on which he works but he also realizes a purpose of his own that gives the law to his *modus operandi* and to which he must subordinate his will.

As indicated in the chapter on ANIMALS, some writers like Montaigne attribute the productivity of animals to reason rather than to instinct. Art then ceases to be one of man's distinctions from the brutes. But if man alone has reason and if the productions of art are works of reason then those who refer to animals as artists speak metaphorically on the basis of what Kant calls an analogy with art. As soon as we call to mind he continues that no rational deliberation forms the basis of their labor we see at once that it is a product of their nature (of instinct) and it is only to their Creator that we ascribe it as art.

This in turn leads to the question whether nature itself is a work of art. Let me suppose the Eleatic Stranger says in the *Sophist* that things which are said to be made by nature

: the work of divine art and that things such are made by man out of these are the work of human art. And so there are two kinds making and production, the one human and the other divine.

If we suppose that the things of nature are originally made by a divine mind how does their production differ from the work of human artists or from biological generation? One answer given in Plato's *Timaeus* conveys the original production of things as a fashioning of primordial matter in the patterns set by the eternal archetypes or ideas. In consequence the divine work would be more like human artistry than either would be like natural reproduction. The emanation of the world from the One according to Plotinus and the production of things out of the substance of God in Spinoza's theory appear on the other hand to be more closely analogous to natural generation than to art.

Both analogies—of creation with art and of generation—are dismissed as false by Christian theologians. God's making is absolutely creative. It presupposes no matter to be formed nor do things issue forth from God's own substance but out of nothing.

Thus Augustine asks: How didst Thou make the heaven and the earth? And he answers:

It was not as a human artificer forming on body from another according to the discretion of his mind which can in some way invest with such a form as it seeth in itself by its inward eye. Verily neither in the heaven nor in the earth didst Thou make heaven and earth nor in the air or waters, seeing these also belong to the heaven and the earth nor in the whole world didst Thou make the whole world because there was no place where to make it before it was made that it might be. For what is, but because Thou art? Therefore Thou art first and they were made and in Thy Word Thou madest them. According to this view human art cannot be called creative, and God cannot be called an artist except metaphorically.

The issue concerning various theories of creation, or of the origin of the universe, is discussed in the chapter on *World*. But here we must observe that according to the view we take of the similitude between human and di-

vine workmanship the line we are able to draw between the realms of art and nature becomes shadowy or sharp.

THE DISCUSSIONS OF ART in the great books afford materials from which a systematic classification of the arts might be constructed but only fragments of such a classification are ever explicitly presented.

For example the seven liberal arts are enumerated by various authors but their distinction from other arts, and their ordered relation to one another do not receive full explication. There is no treatment of grammar, rhetoric and logic (or dialectic) to parallel Plato's consideration of arithmetic, geometry, music and astronomy in the *Republic*, nor is there any analysis of the relation of the first three arts to the other four—traditionally organized as the *trivium* and the *quadrivium*.

However in Augustine's work *On Christian Doctrine* we have a discussion of these arts as they are ordered to the study of theology. That orientation of the liberal arts is also the theme of Bonaventura's *Reduction of the Arts to Theology*. Quite apart from the problem of how they are ordered to one another particular liberal arts receive so rich and varied a discussion in the tradition of the great books that the consideration of them must be distributed among a number of chapters, such as LOGIC, RHYTHM, LANGUAGE (for the discussion of grammar) and MATHEMATICS.

The principles of classification of the fine arts are laid down by Kant from the analogy which art bears to the mode of expression of which men avail themselves in speech with a view to communicating themselves to one another as completely as possible. Since such expression consists in word, gesture and tone he finds three corresponding fine arts—the art of speech, formative art and the art of the play of sensations. In these terms he analyzes rhetoric and poetry, sculpture, architecture, painting and landscape gardening, and music.

A different principle of division is indicated in the opening chapters of Aristotle's *Poetics*. The principle that all art imitates nature suggests the possibility of distinguishing and relating the various arts according to their char-

acteristic differences as *imitations*—by reference to the object imitated and to the medium and manner in which it is imitated by the poet, sculptor or painter and musician. Color and form Aristotle writes are used as means by some who imitate and portray many things by their aid and the voice is used by others. Rhythm alone without harmony is the means in the dancer's imitations. There is further an art which imitates by language alone without harmony in prose or in verse. Aristotle's treatise deals mainly with this art—poetry; it does not develop for the other fine arts the analysis it suggests.

Aristotle's principle also suggests questions about the useful arts. Are such arts as shoe making and house building imitations of nature in the same sense as poetry and music? Does the way in which the farmer, the physician and the teacher imitate nature distinguish these three arts from the way in which a statue is an imitation of a poem or a house?

The Aristotelian dictum about art imitating nature has of course been as frequently challenged as approved. Apart from the issue of its truth the theory of art as imitation poses many questions which Aristotle left unanswered. If there are answers in the great books they are there by implication rather than by statement.

**THE MOST FAMILIAR** distinction between arts—that between the useful and the fine—is also the one most frequently made in modern discussion. The criterion of the distinction needs little explanation. Some of man's productions are intended to be used, others to be contemplated or enjoyed. To describe them in terms of imitation the products of the useful arts must be said to imitate a natural function (the shoe for example the protective function of calloused skin). The imitation merely indicates the use and it is the use which counts. But in the products of the fine arts the imitation of the form, quality or other aspect of a natural object is considered to be the source of pleasure.

The least familiar distinction among the arts is implied in any thorough discussion yet its divisions are seldom if ever named. Within the sphere of useful art some arts work toward a result which can hardly be regarded as an

artificial product. Fruits and grains would grow without the intervention of the farmer yet the farmer helps them to grow more abundantly and regularly. Health and knowledge are natural effects even though the arts of medicine and teaching may aid in their production.

These arts more fully discussed in the chapters on MEDICINE and EDUCATION stand in sharp contrast to those skills whereby man produces the useful things which but for man's work would be totally lacking. In the one case it is the artist's activity itself which imitates or cooperates with nature's manner of working in the other the things which the artist makes by operating on passive materials supplied by nature imitate natural forms or functions.

For the most part the industrial arts are of the second sort. They transform dead matter into commodities or tools. The arts which co-operate with nature usually work with living matter as in agriculture, medicine and teaching. The distinction seems warranted and clear. Yet it is cut across by Adam Smith's division of labor into productive and non-productive. The work of agriculture is associated with industry in the production of wealth but whatever other use they may have physicians and teachers according to Smith do not directly augment the wealth of nations.

If to the foregoing we add the division of the arts into liberal and servile the major traditional distinctions are covered. This last division had its origin in the recognition that some arts like sculpture and carpentry could not effect their products except by shaping matter whereas some arts like poetry or logic were free from matter at least in the sense that they worked productively in symbolic media. But by other principles of classification poetry and sculpture are separated from logic and carpentry as fine from useful art. Logic along with grammar, rhetoric and the mathematical arts is separated from poetry and sculpture as liberal from fine art. When the word liberal is used to state this last distinction its meaning narrows. It signifies only the speculative arts or arts concerned with processes of thinking and knowing.

The adequacy of any classification and the intelligibility of its principles must stand the test of questions about particular arts. The

that books frequently discuss the arts of animal husbandry and agriculture, the arts of cooking and hunting, the arts of war and government. Each raises a question about the nature of art in general, and challenges any analysis of the arts to classify them and explain their peculiarities.

There are two other major issues which have been debated mainly with respect to the fine arts.

The already mentioned concerns the nature and character of art. The opponents of imitation do not deny that there may be some general resemblance between a work of art and a natural object. A drama may remind us of situations we have experienced; music may recall the sound qualities and rhythms of the human voice register, the course of the emotions. Nevertheless, the root idea of artistic creation lies deeper, it is said, than a desire to imitate nature, or to find some pleasure in such resemblances.

According to Tolstoi, the arts serve primarily as a medium of spiritual communication between man and man, to create the ties of human brotherhood. According to Freud, it is emotion or subconscious expression, rather than imitation or communication, which is the deepest function of art; the poet or artist forces us to become aware of our inner selves in which the unconscious impulses are still extant even though they are suppressed. Freud's theory of sublimation of emotion or desire through art seems to contrast with Aristotle's theory of emotional catharsis or purgation. Both Freud is attempting to account for the origin of art, and Aristotle is trying to describe an effect proper to its enjoyment.

The theories of communication, expression, or imitation, attempt to explain art or at least its social value. But there is also a conception of art which, to repeat, explanation, imitation, or otherwise—the spontaneous product of inspiration of divine madness, the work of unaccountable genius. We encounter this notion in the works of Plato and

The other major controversy concerns the regulation of the arts by the state for human welfare and the public good.

Here as before the fine arts (chiefly poetry and music) have been the focus of the debate. It is worth noting, however, that a parallel problem of political regulation occurs in the sphere of the industrial arts. On the question of state control over the production and distribution of wealth, Smith and Marx represent extreme opposites, as Milton and Plato do poles apart on the question of the state's right to censor the artist's work. In this debate, Aristotle stands on Plato's side in many particulars, and Mill with Milton.

The problem of censorship or political regulation of the fine arts presupposes some prior questions. Plato argues in the *Republik* that all poems but "hymns to the gods and praises of famous men" must be banned from the State "for if you go beyond this and allow the beloved muse to enter either in epic or in verse, not law and the reason of mankind which by common consent have ever been deemed the best, but pleasure and pain will be the rulers in our State." Such a view presupposes a certain theory of the fine arts and of their influence on the citizens and the whole character of the community. Yet because both Plato and Aristotle judge that influence to be far from negligible, they do not see any reason in individual liberty for the state to refrain from interfering with the rights of the artist for the greater good of the community.

To Milton and Mill, the measure of the artist's influence does not affect the question of the freedom of the arts from political or ecclesiastical interference. While admitting the need for protection, the interests of peace and public safety, Milton demands complete liberty to know, to utter and to argue freely according to conscience, above all liberties. The sole fit theme is阐述 the cause of liberty. They espouse the cause of freedom—for the artist to express or communicate his work and for the community to receive from him what ever he has to offer.

## CHAPTER 4 ART

### REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of pg. e 12.

PAGE STEREO 5 When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology* 116a 119b, the passage is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposion*, 163b-164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

1 TH & D 1-10<sup>th</sup> One or more of the main divisions of a work (such as PART BK, CH, SECT) are sometimes included in the reference line numbers, in brackets, are given in certain cases e.g. *Iliad*, BK I [6, 283] 12d.

BEST REFERENCE The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbers of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows e.g., OLD TESTAMENT *Vetus Testamentum*, 7-15-(D) II *Exodus*, 16

SYMBOLS The abbreviation esp" calls the reader's attention to one or more especially relevant parts of a whole reference. parsum signifies that the topic is discussed intermittently rather than continuously, in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

## Chapter 5 ASTRONOMY

---

### INTRODUCTION

ASTRONOMY could take its place in this catalog of ideas on the ground that several of the great books are monuments of astronomical science exemplifying the imaginative and analytical powers which have made it one of the most remarkable triumphs of the human mind. Its claim might further be supported by the fact that other great books—of mathematics, physics, theology and poetry—have a context of astronomical imagery and theory. But the inclusion of astronomy can be justified by what is perhaps an even more significant fact, namely that astronomical speculation raises problems and suggests conclusions which have entailed relevance for the whole range of the great ideas.

Man has used astronomy to measure not only the passage of time or the course of a voyage, but also his position in the world, his power of knowing his relation to God. When man first turns from himself and his immediate earthly surroundings to the larger universe of which he is a part, the object which presses on his vision is the ever-changing firmament with its luminous bodies moving with great regularity and upon closer observation with certain perplexing regularities. Always abiding and always changing, the firmament which provides man with the visible boundary of his universe also becomes for him a base in fact an inescapable object of contemplation.

Careful and precise astronomical observations antedate the birth of astronomy as a science. The early interest in the heavenly bodies and their motions is often attributed to the usefulness of the predictions which can be made from a knowledge of celestial phenomena.

Whether the first were wholly utilitarian or partly ingenious and speculative the Egyptians and Babylonians we learn from Herodotus undeniably took patient study of the heavens. They observed and recorded with

immense persistence. They calculated and predicted. They turned their predictions to use through the priestly office of prophecy to foretell eclipses, tides and floods and they employed their calculations in the mundane arts of navigation and surveying to guide travel and fix boundaries. But they did not like the Greeks develop elaborate theories which sought to organize all the observed facts systematically.

With the Greeks, the down-to-earth everyday utility of astronomy seems to count for less than its speculative grandeur. The dignity which they confer upon astronomy among the disciplines reflects the scope and majesty of its subject matter. The Greek astronomer concerned as he is with figuring motions that range through the whole of space and are as old as time or as interminable takes for his object the structure of the cosmos.

Aristotle and Plato pay eloquent tribute to the special worth of astronomy. In the opening chapters of his *Metaphysics* Aristotle associates astronomical inquiry with the birth of philosophy. Apart from usefulness, he says, men delight in the sense of sight and he adds, it is owing to their wonder that men both now begin and at first began to philosophise. They wondered first about the obvious difficulties, but little by little they advanced to greater matters and stated difficulties about the phenomena of the moon and sun and stars and about the genesis of the universe. In his own philosophical thought Aristotle's treatise *On the Heavens* is not only one of the basic natural sciences but certain of its principles have general significance for all the other parts of his philosophy.

A wider view of the importance of astronomy is taken by Plato. In the *Timaeus* he tells on the higher use and purpose for which God has given eyes to us. Had we never seen the

## CHAPTER 5 ASTROLOGY

Still another point of view on the importance of astronomy is represented in the skeptical and humanist attitude of Montaigne. I am very well pleased with the Milesian girl he remarks, who advised the philosopher Thales rather to look to himself than to gaze at heaven. In saying this, or in quoting with approval the question asked of Pythagoras by Anaximenes—

To what purpose should I trouble myself in searching out the secrets of the stars having death or slavery continually before my eyes? —Montaigne intends more than a preference for the moral over the natural sciences. He regards astronomical inquiry as a prime example of man's natural and original disease—presumption. It is presumptuous to suppose that our minds can grasp and plot the course of the heavens when we fail to comprehend things much nearer at hand. Hence Montaigne advises everyone to say in the spirit of Anaximenes Being assaulted as I am by ambition, avante temerity superstition and having so many other enemies of life shall I go cudgel my brains about the world's revolutions?

Kant can be as critical as Montaigne of the frailty of human knowledge. The investigations and calculations of the astronomers, he writes, have shown us the abyss of our ignorance in relation to the universe. But Kant—an astronomer himself as well as a moralist—does not therefore advise us to forsake the study of the heavens. On the contrary he recommends it not only for its scientific value but for its moral significance.

Two things Kant declares in a passage which has become famous fill the mind with ever new and increasing admiration and awe the oftener and more steadily we reflect on them the starry heavens above and the moral law within. The two fit together to produce a single effect. Astronomy with its view of a countless multitude of worlds annihilates, as it were my importance as an animal creature. Morality elevates my worth as an intelligence by my personality in which the moral law reveals to me a life independent of animality and even of the whole sensible world.

Kant's association of the starry heavens with the moral life is not so much an echo of a variant upon, Plato's precept that we apply the courses of intelligence in heaven to the

courses of our own intelligence. But in one passage of Freud we find an almost complete return to the Platonic insight. Order has been imitated from nature he writes man's observations of the great astronomical periodicities not only furnished him with a model but formed the ground plan of his first attempts to introduce order into his own life.

ASTRONOMY HAS connections with biology and psychology as well as with mathematics and physics. The obvious fact that the sun supports terrestrial life—operating here as a unique and indispensable cause—occasions the inference by Aquinas that it may also operate as a cause in the production of new species by spontaneous generation from putrefying matter. This notion bears some resemblance to the theory in contemporary genetics of the effect of cosmic radiations upon gene mutations.

Until these notions in biology speculations concerning celestial influences upon psychological phenomena seem to cross the line between astronomy and astrology. Sometimes the influence upon man and his actions is found in the constellations attending a nativity sometimes it is a particular influence of the sort still signified by the meaning of the word lunacy and sometimes omens and auguries are read in the aspect of the heavens.

The chapters on PROPHETY and SIGN AND SYMBOL deal with the issues raised by astrology. Problems more closely associated with astronomical science and speculation are treated in other chapters. The cosmological problem of the origin of the material universe is discussed in the chapters on ETERNITY TIME, and WORLD the question of its size in the chapter on SPACE the question of whether the celestial spheres are themselves alive or are moved by intelligences or spirits in the chapters on ANGEL and SOUL and the question of the nature of the heavenly bodies in the chapter on MATTER.

This last problem is of crucial significance in the history of astronomy itself. Opposed theories of the motions of the heavenly bodies became correlated with opposed theories concerning their matter—whether that is different in kind from terrestrial matter or the same. It is with reference to these related issues that what

## THE GREAT IDEAS

stars and the sun and the heaven Timaeus says none of the words which we have spoken about the universe would ever have been uttered God invented and gave us sight he continues to the end that we might behold the courses of intelligence in the heaven and apply them to the courses of our own intelligence which are akin to them the unperturbed to the perturbed and that we learning them and partaking of the natural truth of reason might imitate the absolutely unerring courses of God and regulate our own vagaries

For Plato then man's intellectual relation to the heavens does more than innate philosophy Man's self rule his purity and peace of soul is at stake in that relation That is one reason why in both the *Republic* and the *Laws* Plato makes astronomy a required part of the curriculum for the education of ruler He who has not contemplated the mind of nature which is said to exist in the stars and seen the connection of music with these things and harmonized them all with laws and institutions is not able the Athenian Stranger says in the *Laws* to give a reason for such things as have a reason

Plato considers the opposition to astronomy on religious grounds by those who think that men who approach celestial phenomena by the methods of astronomy may become godless because they see things happening by necessity and not by an intelligent will accomplishing good His answer points out that one of the two things which lead men to believe in the gods is the argument from the order of the motion of the stars and of all things under the dominion of the mind which ordered the universe It was a false understanding of these matters which gave rise to much atheism and perplexity

THE ISSUES RAISED by Plato concerning the importance of astronomy for purification and piety for education and politics run through the tradition of western thought Though they are somewhat transformed in the context of Jewish and Christian beliefs and altered by later developments in the science of astronomy itself they remain as matters on which an author's strong assent or dissent forcefully reflects his whole intellectual position

On the one hand astronomers like Ptolemy

Copernicus and Kepler for all their differences on points of scientific theory seem to concur in reaffirming Plato's conception of the bearing of their science on religion and morals Lucretius and Augustine on the other hand while not agreeing with each other seem to disagree with Plato In the tradition of western thought they represent different types of opposition to the Platonic view

Where Plato and his followers including religious Christians like Copernicus and Kepler hold that true piety profits from astronomical study Lucretius hopes that astronomy may help to free men from religious superstitions If when they gaze on the heavenly quarters of the great upper world and direct their thoughts to the courses of the sun and moon they do so with a mind at peace because they see only the workings of natural law and no evidences of a controlling power in the will of the gods then men achieve the natural piety of the scientist —different in the opinion of Lucretius from the false worship which is based on fear

From his own experiences in dealing with the astronomy of the Manichean sect in relation to their religious doctrine Augustine insists that the teachings of religion in no way depend upon astronomy He denies that such knowledge is in any way essential to true piety Though a man does not know even the circles of the Great Bear yet is it folly to doubt he writes that he is in a better state than one who can measure the heavens and number the stars and poised the elements yet neglecteth Thee Who hast made all things in number weight and measure

When Faustus the leader of the Manicheans was found out to have taught falsely of the heaven and stars and of the motions of the sun and moon (although these things pertain not to the doctrine of religion) his religious teachings according to Augustine inevitably suffered ridicule because of his pretension that they derived support from a science of the heavenly bodies Augustine would disengage theology from astronomy His position anticipates that later taken by Cardinal Barberini who during the controversy over the Copernican hypothesis is reported to have told Galileo that as astronomy and religion have quite separate tasks the one teaching how the heavens go, the other how to go to heaven

world since it is only a part of a part i.e. the planetary region he deliberately adds the qualification But I am speaking *now* of the Earth *in so far as it is a part of the edifice of the world and not of the dignity of the governing creatures which inhabit it*

Whether or not it was the traumatic blow to the human ego which Freud conjectures, there can be little doubt that the shift from Ptolemy to Copernicus involved a real shock to the imagination. The Ptolemaic system conforms to the look of the world which is indeed the reason why it is still the one used in practical courses in navigation. Here again Kepler defends Copernicus by explaining why our uncultivated eye sight cannot be other than deceived and why it should learn from reason to understand that things are really different from the way they appear.

A certain disillusionment may result from this affirmation—repeated by every schoolboy who is taught the Copernican system—that despite what we see the sun does not move around the earth and the earth both rotates and revolves. It undermines the trust men placed in their senses and the belief that science would describe the world as they saw it. In order to save the appearances that is to account for the phenomena, science might henceforward be expected to destroy any naive acceptance of them as the reality.

Furthermore though the Ptolemaic world was very large the Copernican universe was much larger. Whereas in the former the radius of the earth was deemed negligible in relation to the radius of the sphere of the fixed stars in the new universe the radius of the earth's orbit around the sun was negligible in relation to the same radius of the sphere of the fixed stars. It can hardly be doubted that this intensified some men's sense of almost being lost in an abyss of infinity. I see those frightful spaces of the universe which surround me Pascal writes and I find myself tied to one corner of this vast expanse, without knowing why I am put in this place rather than in another. When he regards the world's immensity as the greatest sensible mark of the almighty power of God Pascal experiences awe which for him is qualified by reverence. Other men may experience the same feeling but less with reverence than with a

gnawing loneliness born of the doubt that we *vast a cosmos—if cosmos it is rather than chaos—can have been beneficially designed as man's habitation*

WHATEVER THE TRUTH about the effect of the Copernican theory in the order of opinion in a nation and feeling, it did produce a direct result on the intellectual plane. If more than any other single factor led to the overthrow of certain crucial doctrines which had been linked together in the physics and astronomy of Aristotle, it thus radically changed the fundamental principles in terms of which man had understood the order and unity of nature. That scientific event deserves not only the name but the fame of the Copernican revolution.

The revolution in the realm of theory goes much deeper than the substitution of one mathematical construction for another to describe the motions of the world's great bodies. As Freud points out the heliocentric hypothesis associated with the name of Copernicus is as known to the Alexandrian astronomers of antiquity. It is for example attributed to Aristarchus by Archimedes in the *Sand Reckoner*.

As far as the earth's rotation is concerned Ptolemy admits it is quite plausible to suppose the heavens immobile and the earth turning on the same axis from west to east very nearly one revolution a day. As far as the appearances of the stars are concerned he goes on nothing would perhaps keep things from being in accordance with this simpler conjecture.

Why then does Ptolemy reject a supposition which is not only plausible but also in accounting for the appearances *simpler*? In part the answer may be that he does so because the contrary supposition conforms to our ordinary sense-experience of the earth's immobility and the motions of the heavens from east to west. But that is far from being the most important part of the answer. Ptolemy indicates the crucial part when he tells us that the otherwise plausible supposition of a rotating earth becomes altogether absurd when we consider the speed and direction of the motions of bodies within the earth's own atmosphere. His strongest count against the supposition is that it does not conform to the Aristotelian physics which

has come to be called the Copernican revolution represents one of the great crises certainly one of the most dramatic turning points in the development of astronomy and of physics and natural science generally

The Copernican revolution did not take place by the improvement and enlargement of astronomical observations alone nor even by the effect of these on alternative mathematical formulations. If it had not been accompanied by the radical shift from ancient to modern physics—especially with regard to the diversity or uniformity of the world's matter—the Copernican hypothesis concerning the celestial motions would have been no more than a mathematical alternative to the Ptolemaic hypothesis. Copernicus seems to advance it only as such but in the hands of Kepler Galileo and Newton it becomes much more than that. They rather than Copernicus seem to accomplish the revolution connected with his name.

When their contribution is neglected or inadequately grasped the Copernican revolution appears to be as is often popularly supposed merely a shift in astronomical theory. The problem being to organize mathematically the apparent motions of the heavens. Copernicus offers an alternative solution to that of Ptolemy. Instead of treating the earth as stationary and central in the cosmic system Copernicus attributes three motions to the earth by treating it as a planet which revolves around the sun spins on its axis and varies the inclination of its axis with reference to the sun.

What is usually supposed to be revolutionary about this hypothesis is its effect on man's estimate of himself and his place or rank in the universe. On either of the rival hypotheses the apparent motions of the heavens remain unaltered but not man's conception of himself or of his earth or of the universe in which the earth's orbit cuts so small a figure. As Kant suggests man's stature seems to shrink. He becomes a mere speck in the universe which has been enlarged to infinity or at least to an unimaginable immensity. He is displaced from its center to become a wanderer with his planet. Humanity's self esteem according to Freud was thus for the first time deeply wounded he refers to the theory that is associated in our minds with the name of Copernicus as the first great outrage

which humanity had to endure from the hands of science.

It has been questioned whether this interpretation of the Copernican revolution fits all the documents in the case. Freud may be accurately reporting a popular feeling which since the 18th century has become a widespread consequence of Copernican and post Copernican astronomy. But in earlier centuries when the Ptolemaic system prevailed or even after Copernicus the appraisal of man's rank seems to depend more upon the position he occupies in the hierarchy of God's creatures—below the angels and above the brutes—than upon the place or motion of the earth or the size of the world.

Boethius for example finds the Ptolemaic universe large enough to remind man of the infinitesimal space he occupies. Dante too comments on the smallness of the earth in the scheme of things. When in his visionary travel Dante reaches the Empyrean he looks down upon the earth and "with my sight" he tells us,

I returned through all and each of the seven spheres and saw this globe such that I smiled at its mean semblance and that counsel I approve as best which holds it of least account.

Kepler a passionate Copernican deeply concerned with the human significance of astronomy can be found arguing that the new hypothesis involves something more fitting for man than the old. In his last argument in defense of the Copernican view against that of Tycho Brahe as well as that of Ptolemy he declares "it was not fitting that man who was going to be the dweller in this world and its contemplator should reside in one place as in a closed cubicle." It was his office to move around in this very spacious edifice by means of the transportation of the Earth his home. In order properly to view and measure the parts of his world the astronomer needed to have the Earth a ship and its annual voyage around the sun.

Yet the very fact that Kepler argues in this manner may be interpreted as indicating his sense of the drastic implications for man of the altered structure of the universe. Kepler may even be thought to announce the problem of the so called Copernican revolution when in denying that the earth can any longer be reckoned among the primary parts of the great

four arguments in especial (1) From the nature of the two celestial bodies. (2) From the nature of the motion or virtue. (3) From the nature of the place in which the motion occurs. (4) From the perfection of the circle. He then takes each of these arguments, and answers each in turn.

What is extraordinary about Kepler's attack upon the Ptolemaic astronomy cannot be understood without examining Ptolemy's defense of his theory, a defense which Copernicus meets in Ptolemy's own terms rather than, as Kepler does, by going outside them.

Though his expressed intention was to construct a mathematical theory of the celestial motions which would also conform to Aristotle's physics, Ptolemy when he finished, admitted that the complications he had been compelled to add in order to save the "appearances" left him with a theory that did not conform to Aristotle's doctrine of the perfect circular motion of the heavenly spheres. Instead of abandoning Aristotle's physics he defended his theory on the ground that astronomy being mathematical rather than physical, could admit such "cerealistic complications" if they served the purposes of calculation and of saving the appearances."

In the thirteenth and last book of the *Astronomer*, when he faces the fact that his mathematical devices have become exceedingly difficult—and strained from the point of view of the Aristotelian realists—Ptolemy writes: Let no one, then, the difficulty of our devices, find troublesome such hypotheses. It is proper to try and fit as far as possible the simpler hypotheses to the movements of the heavens and if this does not succeed, then any hypotheses possible. Once all the appearances arrived by the consequences of the hypotheses, why should it seem strange that such complications can come about in the movements of heavenly things? We ought not to judge the immobility of heavenly things by comparison with what seems to be simple in the explanation of earthly phenomena. We should instead judge their simplicity from the unchangeableness of the natures in the heavens and their movements. For thus they would appear simple, more than those things which seem so here with us."

Ignoring the supposition that simplicity must be judged differently in different spheres, Copernicus challenges Ptolemy on this on a ground when he proposes simpler hypotheses to fit the movements of the heavens. But in doing so, he seems to adopt the traditional view of the mathematical character of astronomical hypotheses. Yet as will appear, he does not adopt this view in the unqualified form in which Osiander states it in his *Defense of the Hypotheses of the Heavenly Spheres*.

It is the job of the astronomer" Osiander writes, "to use painstaking and skilled observation in gathering together the history of the celestial movements, and then—what he cannot by any line of reasoning reach the true causes of these movements—to think or construct whatever causes or hypotheses he pleases, such that by the assumption of these causes, these same movements can be calculated from the principles of geometry for the past and for the future too."

"It is not necessary," he adds, "that these hypotheses should be true, or even probable; it is enough if they provide a calculus which fits the observations. When for one and the same movement varying hypotheses are proposed as eccentricity or epicycle for the movement of the sun, the astronomer much prefers to take the one which is easiest to grasp."

What distinguishes Kepler from both Ptolemy and Osiander is the way in which he is concerned with the task of alternative hypotheses in astronomy. He looks upon the truth of an hypothesis as something to be judged not merely in mathematical terms according to the adequacy and simplicity of a calculating device, but to be measured by its conformity to the physical realities. At the very beginning of his *Epitome of Copernican Astronomy* he flatly declares that "astronomy is part of physics." And in the opening pages of the fourth book, he insists that astronomy has not one but two ends to save the appearances and to contemplate the true form of the edifice of the World. He follows this immediately by observing that if astronomy had only the first end Tycho Brahe's theory would be as satisfactory as that of Copernicus.

Early in his scientific career before writing the *Epitome* Kepler asserts that one cannot

distinguishes between natural and violent motions assigns certain fixed directions to the natural motions of each of the four elements of matter and denies that these elementary kinds of terrestrial matter enter into the composition of the heavenly bodies

That Aristotle's physics and cosmology lie at the very heart of the issue is confirmed by the way in which Kepler later argues for the Copernican theory against Ptolemy. He does not defend its truth on the ground that it accounts for observable facts which the Ptolemaic hypothesis cannot handle. Nor does he prefer it merely because it is mathematically the simpler hypothesis. On the contrary he specifically notes that anything which can be claimed on mathematical grounds for Copernicus over Ptolemy can be equally claimed for Tycho Brahe over Ptolemy (Brahe's theory was that while the other planets revolve around the sun the sun with its planets revolves around a stationary earth.) According to Kepler the truth of these competing theories must finally be judged physically not mathematically and when the question is put that way as it is not by Copernicus himself Copernicans like Kepler Galileo and Newton take issue with what had been associated with the Ptolemaic theory—the physics of Aristotle.

IN ORDER TO EXAMINE THIS ISSUE IT IS NECESSARY TO STATE BRIEFLY HERE CERTAIN FEATURES OF ARISTOTLE'S PHYSICS WHICH ARE MORE FULLY DISCUSSED IN THE CHAPTERS ON CHANGE ELEMENT MECHANICS AND PHYSICS

Just as Ptolemy's astronomy conforms to what we see as we look at the heavens so Aristotle's physics represents a too simple conformity with everyday sense experience. We observe fire rising and stones falling. Mix earth air and water in a closed container and air bubbles will rise to the top while the particles of earth will sink to the bottom. To cover a multitude of similar observations Aristotle develops the theory of the natural motions and places of the four terrestrial elements—earth air fire and water. Since bodies move naturally only to attain their proper places the great body which is the earth already at the bottom of all things need not move at all. Being in its proper place it is by nature stationary.

TWO OTHER OBSERVATIONS EXERCISE A DECISIVE INFLUENCE ON ARISTOTLE'S THEORY. THE NAKED EYE SEES NO TYPE OF CHANGE IN THE HEAVENLY BODIES OTHER THAN LOCAL MOTION OR CHANGE OF PLACE. LIKE TERRESTRIAL BODIES THEY DO NOT APPEAR TO COME INTO BEING OR PERISH. THEY DO NOT CHANGE IN SIZE OR QUALITY. FURTHERMORE WHEREAS THE NATURAL LOCAL MOTION OF SUB LUNAR BODIES APPEARS TO APPROXIMATE THE PATH OF A STRAIGHT LINE THE LOCAL MOTION OF THE CELESTIAL BODIES APPEARS TO BE CIRCULAR RATHER THAN RECTILINEAR.

TO COVER THESE OBSERVATIONS Aristotle's theory posits a different kind of matter for celestial and terrestrial bodies. An incorruptible matter must constitute the great orbs which are subject to local motion alone and have the most perfect kind of local motion—that of a circle. Since they are subject to generation and corruption to change of quality and quantity and are in local motion along straight lines terrestrial bodies are of a corruptible matter.

THE INTERCONNECTION OF ALL THESE POINTS IS MARKED BY AQUINAS WHEN HE SUMMARIZES ARISTOTLE'S DOCTRINE. PLATO AND ALL WHO PRECEDE ARISTOTLE HE WRITES HELD THAT ALL BODIES ARE OF THE NATURE OF THE FOUR ELEMENTS AND CONSEQUENTLY THAT THE MATTER OF ALL BODIES IS THE SAME. BUT THE FACT OF THE INCORRUPTIBILITY OF SOME BODIES WAS ASCRIBED BY PLATO NOT TO THE CONDITION OF MATTER BUT TO THE WILL OF THE ARTIFICER GOD. THIS THEORY AQUINAS CONTINUES ARISTOTLE DISPROVES BY THE NATURAL MOVEMENTS OF BODIES. FOR SINCE HE SAYS THAT THE HEAVENLY BODIES HAVE A NATURAL MOVEMENT DIFFERENT FROM THAT OF THE ELEMENTS IT FOLLOW THAT THEY HAVE A DIFFERENT NATURE FROM THEM. FOR MOVEMENT IN A CIRCLE WHICH IS PROPER TO THE HEAVENLY BODIES IS NOT BY CONTRARIES WHEREAS THE MOVEMENTS OF THE ELEMENTS ARE MUTUALLY OPPOSITE ONE TENDING UPWARDS ANOTHER DOWNWARDS. AND AS GENERATION AND CORRUPTION ARE FROM CONTRARIES IT FOLLOWS THAT WHEREAS THE ELEMENTS ARE CORRUPTIBLE THE HEAVENLY BODIES ARE INCORRUPTIBLE.

THE SAME POINTS WHICH AQUINAS RELATES IN HIS DEFENSE OF THE ARISTOTELIAN THEORY KEPLER ALSO PUTS TOGETHER WHEN HE EXPOUNDS THAT THEORY IN ORDER TO ATTACK IT AND THE PTOLEMAIC ASTRONOMY WHICH TRIES TO CONFORM TO IT. BY WHAT ARGUMENTS DID THE ANCIENTS ESTABLISH THEIR OPINION WHICH IS THE OPPOSITE OF YOURS? HE ASKS. BY

But the unification of nature which Kepler began and Newton completed when set against Aristotle's physics may be even more radical than Newton's theory because of the amazing way in which it covered the widest variety of phenomena by the simplest most universal formula. It is considered by Kant to have established the truth of that which Copernicus at first assumed only as an hypothesis. But the larger contribution in Whitehead's opinion is the idea of the neutrality of situation and the universality of physical laws holding uniformly in every part.

Whatever position we take today concerning the kind of truth which is possessed by hypotheses in mathematical physics we now demand in the point of the three Copernicans—Kepler, Galileo and above all Newton—that physical hypotheses account at once for all the phenomena of the inanimate universe. Whatever the truth of modern as opposed to ancient physics the Newtonian universe is so thoroughly established in our minds and feelings that when we are reminded of the other universe in which men lived before the Copernican revolution we tend to think it quaint and incredible preposterous and superstitious none of which it was.

Finally from the point of view of our understanding of natural science itself the astronomical controversy has been considering almost an archetypal model. It is necessary of course to appreciate the real achievement of Ptolemy as well as of Copernicus and Kepler in order to realize how genuine and difficult the issues were. Facts unknown to all of them may now have closed the dispute decisively but issues in other spheres of modern science almost identical in pattern with that great astronomical one are not yet closed and to the degree that we are able to re-enact in our minds the motion of thought on both sides of the Copernican controversy we can confront comparable scientific issues—still open—with open minds.

Darwin for example finds in the astronomical controversy a precedent to which he can appeal in the defense of natural selection against its adversaries. The belief in the revolution of the earth on its own axis he writes "as until lately or supported by any direct evidence." But the absence of direct evidence does not lead to a scientific theory without foundation.

Darwin argues, if it has the power to explain several large classes of facts, which it can hardly be supposed that a false theory would explain in so satisfactory a manner. Darwin defends the theory of natural selection as having such power. To those who object that this is an unsafe method of arguing he replies—citing an example from astronomy—that it has often been used by the greatest natural philosophers.

The GREAT BOOKS of astronomy most lucidly exhibit the essential pattern of that kind of natural science which has, in modern times, come to be called mathematical physics. Though that phrase may be modern the ancients recognized the special character of the sciences which apply mathematics to nature and which consult experience to choose among hypotheses arising from different mathematical formulations.

Outlining a curriculum for liberal education Plato in the *Republic* groups music and astronomy along with arithmetic and geometry as mathematical arts or sciences. In that context he treats them as pure mathematics. Astronomy is no more concerned with the visible heavens than music is with audible tones. Music is rather the arithmetic of harmonies astronomy the geometry of motions. But in the *Timaeus* Plato turns mathematical formulae and calculations to use in telling what he calls a likely story concerning the formation and structure of the sensible world of becoming. Here rather than in the *Republic* we have according to Whitehead the initial conception of mathematical physics as well as deep insight into its nature and pattern.

Aristotle criticizes the notion of astronomy as a purely mathematical science. Just as the things of which optics and mathematical harmonies treat cannot be divorced from the sensible so the objects of astronomy are also the visible heavens. Astronomical experience Aristotle writes supplies the principles of astronomical science. Yet though its subject matter is physical and its method is in part empirical astronomy like optics and harmonics takes the form of mathematical demonstration and it is for this reason that Aquinas later calls such disciplines mixed and intermediate sciences.

leave to the astronomer absolute license to feign no matter what hypotheses. He complains that astronomers too often constrain their thought from exceeding the limits of geometry.

It is necessary to go beyond geometry into physics to test the consequences of competing hypotheses which are equally good mathematically. You must seek the foundations of your astronomy he tells his fellow scientists in a more elevated science I mean in physics or metaphysics.

Because Kepler thus conceives the task and truth of astronomy Duhem in his great history of astronomy calls him a realistic Copernican Galileo also Duhem thinks was a realistic Copernican. To confirm by physics the Copernican hypotheses he writes is the center towards which converge Galileo's observations as an astronomer and his terrestrial mechanics.

Newton was the third member of this triumvirate. For him there remained the solution of the problem of deducing Kepler's formulation of the planetary orbits in a manner consistent with Galileo's laws of motion in the dynamics of bodies falling on the earth's surface. But the very posing of this problem itself depended on the insight that terrestrial and celestial mechanics can proceed according to the same principles and laws. That insight entailed the complete overthrow of the ancient physics with its division of the universe into two distinct parts having different kinds of matter and different laws of motion.

COPERNICUS who despite Osiander's apologetics believed his theory to be true did not himself face the great point at issue in the Copernican revolution—the material uniformity of the physical universe. We shall subsequently consider the question of the truth of astronomical hypotheses but whether or not Copernicus and the Copernicans had *in their own day* a right to believe their theory true it was the acceptance of the Copernican hypothesis as true which led Kepler and Galileo to deny the truth of Aristotelian physics.

If the earth is not at the center and stationary then the basic doctrine of a natural direction in motion and a natural place of rest for the various elements is completely upset. If the earth is one of the planets then anything true

on the earth—or of the earth such as Gilbert's theory of the magnetic fields generated by the earth's axial rotation—could be equally true of all the other planets.

Read the philosophy of magnetism of the Englishman William Gilbert writes Kepler for in that book although the author did not believe that the Earth moved nevertheless he attributes a magnetic nature to it by very many arguments. Therefore it is by no means absurd or incredible that any one of the primary planets should be what one of the primary planets namely the Earth is. Such a statement plainly shows that when the earth becomes a planet as it does in Copernican theory no obstacle remains to the assertion of a homogeneity between the earth and the other planets both in matter and motion. The old physical dualism of a supralunar and a sublunar world is abandoned.

Not the movement of the earth Whitehead remarks but the glory of the heavens was the point at issue for to assert the heavens to be of the same stuff and subject to the same laws as the rest of nature brings them down to the plane of earthly physics. That is precisely what Newton finally does when in the enunciation of his Third Rule of reasoning in natural philosophy he dryly but explicitly completes the Copernican Revolution Those qualities of bodies which are found to belong to all bodies within the reach of our experiments are Newton maintains to be esteemed the universal qualities of all bodies whatsoever.

In the bifurcated world of ancient theory astronomy had a very special place among the natural sciences proportionate to the glory of the heavens. But with Newton it could be completely merged into a general mechanics whose laws of motion have universal application. That merger begun by Newton has been perfected since his day. The last obstacle to the generalization lay in the apparent discrepancies between electrical phenomena on the subatomic scale and gravitational phenomena on the astrophysical scale. But in our own time the unified field equations of Einstein's theory of relativity embrace the very large and the very small motions of matter within a single conceptual scheme with radical consequences for the revision of the Newtonian or classical mechanics.

The logic of such verification has already been suggested in the discussion of the geocentric and heliocentric hypotheses. It is further considered in the chapter on Hypotheses. To be satisfactory an hypothesis must—in the language used earlier since Simplicius—“save the appearances,” that is, account for the relevant phenomena. But two hypotheses (as for example the geocentric and heliocentric) may at a certain time, do an equally good job of saving the appearances. Then the choice between them becomes a matter of the greater mathematical elegance of one than the other.

That however does not give the mathematically superior theory a greater claim to truth. So far as reality is concerned it is only in Plato's words, a likely story, or as Aquinas points out with reference to the geocentric hypothesis, the theory of eccentrics and epicycles is considered as established because thereby the sensible appearances of the heavenly movements can be explained—not however as if this reason were sufficient since some other theory might explain them.

Two hypotheses may be equally satisfactory for the range of phenomena they were both devised to fit. But only one of them may have the quite amazing virtue of fitting other sets of observations not originally thought to be related to the phenomena for which the hypoth-

esis was devised. The word *confluence* has been used to name the property of an hypothesis which in addition to saving a limited field of appearances succeeds in fitting many other phenomena which seem to have become related—to have *jumped to*, either under its cover, explanation. The heliocentric hypothesis, as developed by Newton's laws of motion and theory of gravitation certainly has this property of confluence to a high degree for it covers both celestial and terrestrial phenomena and a wide variety of the latter.

Is the heliocentric hypothesis true then? If the truth of an hypothesis depends on the range of the phenomena it fits or saves, it might seem to be so, for by its confluence it accounts for phenomena that the Ptolemaic theory cannot handle. But though this may cause us to reject the unsuccessful hypothesis, does it establish beyond doubt the truth of the successful one? Or to put the question another way, is not our judgment here a comparative one rather than absolute? Are we saying more than that one hypothesis is more successful than another in doing what an hypothesis should do? Are we logically entitled to regard that success as the sign of its exclusive truth or must we restrict ourselves to the more modest statement that as the better hypothesis, it simply tells a more likely story about reality?

## OUTLINE OF TOPICS

1 The end, dignity, and utility of astronomy	► ca 99
2 The method of astronomy	
2a Observation and measurement instruments and tables	
2b The use of hypotheses the heliocentric and geocentric theories	100
2c The relation of astronomy to mathematics the use of mathematics by astronomy	
3 Causes in astronomy	101
3a Formal archetypal causes the number and the music of the spheres	
3b Physical efficient causes gravitation and action-at-a-distance	
4 The relation of astronomy to the other liberal arts and sciences the place of astronomy in the educational curriculum	
5 Astronomy and cosmology the theory of the world or universe as reflecting astronomical conceptions	

The development of astronomy from Plato and Aristotle through Ptolemy Copernicus and Kepler to Galileo and Newton thus constitutes an extraordinary set of case histories for the study of what J B Conant calls the tactics and strategy of science and especially mathematical physics. But astronomy has one peculiar feature which distinguishes it from other branches of mathematical physics. It is empirical rather than experimental. The astronomer does not control the phenomena he observes. He does not like the physicist chemist or physiologist produce an isolated system of events by means of the laboratory arts.

Harvey comments on this aspect of astronomy when he proposes an experiment that will enable the physiologist to do what the astronomer cannot do namely deliberately prepare phenomena for examination by the senses. The astronomer must be content with the appearances as they are given. Defending psycho analysis against attack on the ground that it admits of no experimental proof Freud points out that his critics might have raised the same objection against astronomy experimentation with the heavenly bodies is after all exceedingly difficult. There one has to rely on observation.

Since the invention of the telescope the astronomer has had instruments of all sorts to increase the range and accuracy of his observations but the fact that the place where he uses such apparatus is called an observatory rather than a laboratory indicates that these instruments do not make astronomy an experimental science. Nevertheless as Bacon points out the telescope enabled Galileo to do more than improve upon the accuracy of prior observations. It brought within the range of observation certain celestial phenomena hitherto imperceptible to the naked eye such as the phases of Venus the satellites of Jupiter and the constitution of the Milky Way.

Concerning the last of these Pascal later remarks that the ancients can be excused for the idea they had of the cause of its color. The weakness of their eyes not yet having been artificially helped they attributed this color to the great solidity of this part of the sky but it would be inexcusable for us, he adds to retain the same thought now that aided by the advantages of the telescope we have discovered

in the Milky Way an infinity of small stars more abundant splendor has made us recognize the real cause of this whiteness.

BECAUSE IT IS A mixed science both empirical and mathematical astronomy advances not only with the improvement and enlargement of observation but also with new insights developments in mathematics Kant gives striking examples of how the work of the pure mathematicians contributes to the advance of physics and astronomy. Their discoveries are often made without any knowledge of their application to natural phenomena. They investigated the properties of the parabola, he writes in ignorance of the law of terrestrial gravitation which would have shown them its application to the trajectory of heavy bodies.

So again they investigated the properties of the ellipse without a suspicion that a gravitation was also discoverable in the celestial bodies, without knowing the law that governs it as the distance from the point of attraction varies, and that makes the bodies describe this curve in motion.

So amazing are such mathematical anticipations that Kant thinks Plato may be pardoned for supposing that pure mathematics could dispense with all experience in discovering the constitution of things. Whether or not Plato goes to this extreme he does in the *Republic* seem to suggest the reverse of Kant's conception of the relationship between mathematics and astronomy. The spangled heavens should be used as a pattern he writes and with view to that higher knowledge — mathematics. Astronomy should be used to instigate discoveries in pure mathematics by suggesting good problems and by requiring formulations which transcend an interest in the truth about the heavens.

This twofold relation between mathematical discovery and empirical observation is present in the development of astronomy itself as of all branches of mathematical physics. But there is another aspect of the relationship which must be taken into account if we are to consider the problem of truth in such sciences. The way in which mathematical formulations fit the phenomena measures the truth of rival hypotheses with respect to the same reality.

## CHAPTER 5 ASTROLOGY

## REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passage referred to. For example, in *Astronomer II*, BK II 165 183 112d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of pg. 165.

**PAGES** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in *Saint James Park*, pg. 116a 119b, the passage begins in the lower half of pg. 116 and ends in the upper half of pg. 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in *Plato Symposium* 163b-164c the passage begins in the lower half of the left hand side of pg. 163 and ends in the upper half of the right hand side of pg. 164.

**AUTHORS** One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference line numbers, in brackets, are given in certain cases, e.g., *II*, BK II [or -3] 12d.

**BIBLE REFERENCES** The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows, e.g., Old Testament / *Exodus* 7:1-(D) *II Esdras* 4:6.

**SYMBOLS** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of the reference passage suggesting that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the use of the references, see the Explanation of References. Still further guidance in the use of *The Great Books* consult the Preface.

## ADDITIONAL READINGS

Listed below are works not included in *Great Books of the Western World*, but relevant to the ideas and topics with which this chapter deals. These works are divided into two groups:

- I. Works by authors represented in this collection.
- II. Works by authors not represented in this collection.

For the date, place, and other facts concerning the publication of the works cited, consult the B biography of Additional Readings which follows the last chapter of *The Great Ideas*.

## *Chapter 6 BEAUTY*

### *INTRODUCTION*

TRUTH goodness and beauty form a triad of terms which have been discussed together throughout the tradition of western thought.

They have been called transcendental on the ground that everything which is in some measure or manner subject to denomination as true or false good or evil beautiful or ugly. But they have also been assigned to special spheres of being or subject matter—the true to thought and logic the good to action and morals the beautiful to enjoyment and aesthetics.

They have been called the three fundamental values with the implication that the worth of anything can be exhaustively judged by reference to these three standards—and no others. But other terms such as pleasure or utility have been proposed either as additional values or as significant variants of the so called fundamental three or even sometimes as more fundamental. Pleasure or utility for example has been held by men like Spinoza or Mill to be the ultimate criterion of beauty or goodness.

Truth goodness and beauty singly and together have been the focus of the age old controversy concerning the absolute and the relative the objective and the subjective the universal and the individual. At certain times it has been thought that the distinction of true from false good from evil beautiful from ugly has its basis and warranty in the very nature of things and that a man's judgment of these matters is measured for its soundness or accuracy by its conformity to fact. At other times the opposite position has been dominant. One meaning of the ancient saying that man is the measure of all things applies particularly to the true good and beautiful. Man measures truth goodness and beauty by the effect things have upon him according to what they seem to him to be. What

seems good to one man may seem evil to another. What seems ugly or false may also seem beautiful or true to different men or to the same man at different times.

Yet it is not altogether true that these three terms have always suffered the same fortunes. For Spinoza goodness and beauty are subjective but not truth. Because he has persuaded himself that all things which exist are made for him man Spinoza says judges that to be of the greatest importance which is most useful to him and he must esteem that to be of surpassing worth by which he is most beneficially affected. The notions of good and evil beauty and ugliness do not conform to anything in the nature of things. The ignorant says Spinoza nevertheless call the nature of a thing good evil sound putrid or corrupt just as they are affected by it. For example if the motion by which the nerves are affected by means of objects represented to the eye conduces to well being the objects by which it is caused are called beautiful while those exciting a contrary motion are called deformed.

BEAUTY HAS BEEN most frequently regarded as subjective or relative to the individual judgment. The familiar maxim, *de gustibus non disputandum* has its original application in the sphere of beauty rather than truth and goodness. Truth is disputable. Hume writes not taste. No man reasons concerning another's beauty but frequently concerning the justice or injustice of his actions. Thus even when it was supposed that judgments of the true and the good could have a certain absoluteness or universality—or at least be considered as something about which men might reach agreement through argument—opinions about beauty were set apart as useless to dispute. Beauty being simply a matter of individual taste it

find no basis for argument or reasoning objective ground for settling differences on.

The ancient skeptics down to our own have noted the great variety of traits, sharply opposed, which have been considered beautiful at different times and places. As, for example, says of beauty according to our appetite and liking, "paint it black and tawny, with great lips, big flat noses, and load the caravans with the nostrils with great rings of gold like hanging down to the mouth. In the greatest ears are the most beautiful, they stretch them out as far as they can by."

There are elsewhere, nations that take care to blacken their teeth, and hate to eat white elsewhere people that paint red. The Italian fashion beauty goes to the Spaniards, gaunt and slender; one makes it white, another brown, soft and delicate; another strong and big.

Just as the preference in beauty is by Plato to the phænomenal figure the Greeks give it to the pyramidal or the round and cannot swallow a god in the form of a ball."

Like Montaigne, Durmaz gives an extensive list of the things men have found beautiful, many of them so various and contradictory that it would seem there could be no objective standards for judgments of beauty. If any consensus could be reached among individuals about what is beautiful, the skeptics or relativists usually claim it by reference to the prevalence of two prejudices, or customary standards, such as those held by different tribes and cultures and at different times and places.

Beginning in the sphere of beauty, subjectivism or relativism preaches first to judgments good and evil, and then to statements about what, never in the opposite direction. It becomes complete when, as so frequently happens in our own time, what is good or true is held to be just as much a matter of private taste or literary opinion as what is beautiful.

The problem of the objectivity or subjectivity of beauty can, of course, be separated from similar problems with regard to truth and goodness, but any attempt to solve it will necessarily both draw on and bear on the discussion

of these related problems. The degree to which the three problems must be considered to be interdependent is determined by the extent to which each of the three terms requires the context of the other two for its definition and analysis.

BEAUTY IS, perhaps, not definable in any strict sense of definition. But there have been, nevertheless, many attempts to state with the brevity of definition, what beauty is. Usually notions of goodness, or correlative notions of desire and love enter into the statement.

Aquinas, for example, declares that "the beautiful is the same as the good, and they differ in a point only." The notion of good is that which calms the desire while the notion of the beautiful is that which calms the desire by being seen or known. This, according to Aquinas, implies that beauty adds to goodness a relation to the cognitive faculty, so that good means that which simply pleases the appetite while the beautiful is something pleasant to apprehend."

Because of its relation to the cognitive power, Aquinas defines the beautiful as "that which pleases upon being seen" (*ad quod visum placet*). Hence he continues, beauty consists in due proportion, for the senses delight in things duly proportioned because the sense too is a sort of reason as is every cognitive power.

The pleasure or delight involved in the perception of beauty belongs to the order of knowing rather than to desire or action. The knowing, furthermore, seems to be different from that which is proper to science, for it is concerned with the individual thing rather than with universal natures, and it occurs intuitively or contemplatively rather than by judgment and reasoning. There is a mode of truth peculiar to the beautiful, as well as a special kind of goodness.

Fully to understand what Aquinas is saying about beauty we are required to understand his theory of goodness and truth. But enough is immediately clear to give meaning to Eric Gill's advice to those who are concerned with making things beautiful. Look after goodness and truth he says, and beauty will take care of herself.

To define beauty in terms of pleasure would

seem to make it relative to the individual for what gives pleasure—even contemplative pleasure—to one man may not to another. It should be noted however that the pleasure in question is attributed to the object as its cause. It may be asked therefore what in the object is the cause of the peculiar satisfaction which constitutes the experience of beauty? Can the same object just as readily arouse displeasure in another individual and a consequent judgment of ugliness? Are these opposite reactions entirely the result of the way an individual feels?

Aquinas appears to meet this difficulty by specifying certain objective elements of beauty, or conditions as he calls them. Beauty includes three conditions he writes *integritas* or *perfection* since those things which are unimpaired are by that very fact ugly due *proportion* or *harmony* and lastly *brightness* or *claritas* whence things are called beautiful which have a bright color. Quite apart from individual reactions objects may differ in the degree to which they possess such properties—traits which are capable of pleasing or displeasing their beholder.

This does not mean that the individual reaction is invariably in accordance with the objective characteristics of the thing beheld. Men differ in the degree to which they possess good perception—and sound critical judgment—even as objects differ in the degree to which they possess the elements of beauty. Once again in the controversy concerning the objectivity or subjectivity of beauty there seems to be a middle ground between the two extreme positions which insists upon a beauty intrinsic to the object but does not deny the relevance of differences in individual sensibility.

William James would seem to be indicating such a position when in his discussion of aesthetic principles he declares We are once and for all so made that when certain impressions come before our mind one of them will seem to call for or repel the others as its companions. As an example he cites the fact that a note sounds good with its third and fifth. Such an aesthetic judgment certainly depends upon individual sensibility and James adds to a certain extent the principle of habit will explain [it]. But he also points out that to explain all aesthetic judgements in this way would be ab-

surd for it is notorious how seldom natural experiences come up to our aesthetic demands. To the extent that aesthetic judgments express inner harmonies and discords between objects of thought the beautiful according to James has a certain objectivity and good taste can be conceived as the capacity to be pleased by objects which should elicit that reaction.

KANT'S THEORY OF the beautiful to take another conception must also be understood in the general context of his theory of knowledge and his analysis of such terms as good pleasure and desire. His definition like that of Aquinas, calls an object beautiful if it satisfies the observer in a very special way—not merely pleasing his senses or satisfying his desires in the ways in which things good as means or ends fit a man's interests or purposes. The beautiful according to Kant pleases immediately apart from all interest. The pleasure that results from its contemplation may be said to be the one and only disinterested and free delight for with it no interest whether of sense or reason extorts approval.

The aesthetic experience is for Kant also unique in that its judgment is represented as universal i.e. valid for every man yet at the same time it is recognizable by means of any universal concept. In other words all judgments of taste are singular judgments they are without concept in the sense that they do not apply to a class of objects. Nevertheless they have a certain universality and are not merely the formulation of a private judgment. When we call the object beautiful Kant says we believe ourselves to be speaking with a universal voice and lay claim to the concurrence of every one whereas no private sensation would be decisive except for the observer alone and his liking.

In saying that aesthetic judgments have subjective not objective universality and in holding that the beautiful is the object of a necessary satisfaction Kant also seems to take the middle position which recognizes the subjectivity of the aesthetic judgment without denying that beauty is somehow an intrinsic property of objects. With regard to its subjective character Kant cites Hume to the effect that

"although critics are able to reason more plausibly than cooks they must still share the same fate. The universal character of the aesthetic judgment however keeps it from being completely subjective and Kant goes to some length to refute the notion that in matters of the beautiful one can seek refuge in the adage that every one has his own taste.

The fact that the aesthetic judgment requires universal assent even though the universal rule on which it is based cannot be formulated does not of course preclude the failure of the object to win such assent from many individuals. Not all men have good taste or having it have it to the same degree.

THE FOREGOING CONSIDERATIONS—selective rather than exhaustive—show the coconnection between definitions of beauty and the problem of aesthetic training. In the traditional discussion of the ends of education there is the problem of how to cultivate good taste—the ability to discriminate critically between the beautiful and the ugly.

If beauty is entirely subjective, entirely a matter of individual feeling, then except for conformity to standards set by the customs of the time and place no criteria could seem to be available for measuring the taste of individuals. If beauty is simply objective—something immediately apparent to observation as are the simple sensible qualities—no special training would seem to be needed for sharpening our perception of it.

The genuineness of the educational problem in the sphere of beauty seems thereby to depend upon a theory of the beautiful which avoids both extremes and which permits the educator to aim at a development of individual sensibilities to accords with objective criteria of taste.

THE FOREGOING CONSIDERATIONS also provide background for the problem of beauty in nature and in art. As indicated in the chapter on ART the consideration of art in recent times tends to become restricted to the theory of the fine arts. So too the consideration of beauty has become more and more an analysis of excellence in poetry music, painting and sculpture. In consequence the meaning of the word aes-

thetic has progressively narrowed until now it refers almost exclusively to the appreciation of works of fine art, where before it connoted any experience of the beautiful in the things of nature as well as in the works of man.

The question is raised then whether natural beauty or the perception of beauty in nature involves the same elements and causes as beauty in art. Is the beauty of a flower or of a flowing field determined by the same factors as the beauty of a still life or a landscape painting?

The affirmative answer seems to be assumed in a large part of the tradition. In his discussion of the beautiful in the *Poetics* Aristotle explicitly applies the same standard to both nature and art. To be beautiful he writes, a living creature and every whole made up of parts must not only present a certain order in its arrangement of parts but also be of a certain magnitude. Aristotle's notion that art imitates nature indicates a further relation between the beautiful in art and nature. Unity proportion and clarity would then be elements common to beauty in its every occurrence though these elements may be embodied differently in things which have a difference in their mode of being as do natural and artificial things.

With regard to the beauty of nature and of art Kant tends to take the opposite position. He points out that the mind cannot reflect on the beauty of nature without at the same time finding its interest engaged. Apart from any question of use that might be involved he concludes that the interest aroused by the beautiful in nature is akin to the moral particularly from the fact that nature in her beautiful products displays herself as art not as a mere matter of chance but as it were designed according to a law-directed arrangement.

The fact that natural things and works of art stand in a different relation to purpose or interest is for Kant an immediate indication that their beauty is different. Their susceptibility to disinterested enjoyment is not the same. Yet for Kant as for his predecessors nature provides the model or archetype which art follows and he even speaks of art as an imitation of nature.

The Kantian discussion of nature and art moves into another dimension when it con-

siders the distinction between the beautiful and the sublime. We must look for the sublime Kant says 'not in works of art nor yet in things of nature that in their very concept import a definite end e.g. animals of a recognized natural order but in rude nature merely as involving magnitude. In company with Longinus and Edmund Burke Kant characterizes the sublime by reference to the limitations of human powers. Whereas the beautiful consists in limitation the sublime immediately involves or else by its presence provokes a representation of limitlessness which may appear indeed, in point of form to contravene the ends of our power of judgement to be ill adapted to our faculty of presentation and to be as it were an outrage on the imagination.

Made aware of his own weakness man is dwarfed by nature's magnificence but at that very moment he is also elevated by realizing his ability to appreciate that which is so much greater than himself. This dual mood signalizes man's experience of the sublime. Unlike the enjoyment of beauty it is neither disinterested nor devoid of moral tone.

**TRUTH IS USUALLY** connected with perception and thought the good with desire and action. Both have been related to love and in different ways to pleasure and pain. All these terms naturally occur in the traditional discussion of beauty partly by way of definition but also partly in the course of considering the faculties engaged in the experience of beauty.

Basic here is the question whether beauty is an object of love or desire. The meaning of my answer will of course vary with different conceptions of desire and love.

Desire is sometimes thought of as fundamentally acquisitive directed toward the appropriation of a good whereas love on the contrary aims at no personal aggrandizement but rather with complete generosity wishes only the well-being of the beloved. In this context beauty seems to be more closely associated with a good that is loved than with a good desired.

Love moreover is more akin to knowledge than is desire. The act of contemplation is sometimes understood as a union with the ob-

ject through both knowledge and love. Here again the context of meaning favors the alignment of beauty with love at least for theories which make beauty primarily an object of contemplation. In Plato and Plotinus, and on another level in the theologians the two considerations—of love and beauty—fuse together inseparably.

It is the privilege of beauty Plato thinks, to offer man the readiest access to the world of ideas. According to the myth in the *Phaedrus*, the contemplation of beauty enables the soul to grow wings. This experience ultimately intellectual in its aim is described by Plato as identical with love.

The observer of beauty is amazed when he sees anyone having a godlike face or form, which is the expression of divine beauty and at first a shudder runs through him and again the old awe steals over him. Then looking upon the face of his beloved as of a god he reverences him and if he were not afraid of being thought a downright madman he would sacrifice to his beloved as to the image of a god. When the soul bathes herself in the waters of beauty her constraint is loosened and she is refreshed and has no more pangs and pains. This state of the soul enraptured by beauty Plato goes on to say is by men called love.

Sharply opposed to Plato's intellectualization of beauty is that conception which connects it with sensual pleasure and sexual attraction. When Darwin for instance considers the sense of beauty he confines his attention almost entirely to the colors and sounds used as attractions of the opposite sex. Freud likewise while admitting that psychoanalysis has less to say about beauty than about most things claims that its derivation from the realms of sexual sensation seems certain.

Such considerations may not remove beauty from the sphere of love but as the chapter on Love makes clear love has many meanings and is of many sorts. The beautiful which is sexually attractive is the object of a love which is almost identical with desire—sometimes with lust—and certainly involves animal impulses and bodily pleasures. The taste for the beautiful writes Darwin at least as far as female beauty is concerned is not of a special nature in the human mind.

On the other hand Darwin attributes to man alone an aesthetic faculty for the appreciation of beauty apart from love or sex. No other animal he thinks, is capable of admiring such scenes as the heavens at night, a beautiful landscape or refined music, but such high tastes are acquired through culture and depend on complex associations; they are not enjoyed by barbarians or by uneducated persons. For Freud however the appreciation of such beauties remains ultimately sexual in motivation, no matter how sublimated in effect. The love of beauty, he says, is the perfect example of a feeling with an inhibited aim. Beauty and attraction are first of all the attributes of a sexual object.

The theme of beauty's relation to desire and love is connected with another basic theme—the relation of beauty to sense and intellect or to the realms of perception and thought. The two discussions naturally run parallel.

The main question here concerns the existence of beauty in the order of purely intelligible objects, and its relation to the sensible beauty of material things. Plotinus holding that beauty of every kind comes from a form or reason, traces the beauty which is in bodies, as well as that which is in the soul, to its source in the eternal intelligence. This intelligible beauty lies outside the range of desire even as it is beyond the reach of sense perception. Only the admiration or the adoration of love is proper to it.

THESE DISTINCTIONS in types of beauty—natural and artificial, sensible and intelligible, even perhaps material and spiritual—indicate the scope of the discussion though not all writers on beauty deal with all its manifestations.

Primarily concerned with other subjects many of the great books make only an indirect contribution to the theory of beauty, the moral treatises which consider the spiritual beauty of a noble man or of a virtuous character, the cosmologies of the philosophers or scientists which find beauty in the structure of the world—the intelligible not sensible order of the universe, the mathematical works which exhibit and sometimes enunciate an awareness of formal beauty in the necessary connection

of ideas, the great poems which crystallize beauty in a scene in a face in a deed and above all, the writings of the theologians which do not try to do more than suggest the ineffable splendor of God's infinite beauty, a beauty fused with truth and goodness, all absolute in the one absolute perfection of the divine being. The Divine Goodness observes Dante which from Itself spurns all envy, burning in Itself so sparkles that It displays the eternal beauties.

Some of the great books consider the various kinds of beauty not so much with a view to classifying their variety as in order to set forth the concordance of the grades of beauty with the grades of being and with the levels of love and knowledge.

The ladder of love in Plato's *Symposium* describes an ascent from lower to higher forms of beauty. He who has been instructed thus far in the things of love Diotima tells Socrates and who has learned to see beauty in due order and succession when he comes toward the end will suddenly perceive a nature of wondrous beauty, beauty absolute, separate, simple and everlasting which without diminution and without increase or any change is imparted to the ever growing and perishing beauties of all other things. He who from these ascending under the influence of true love begins to perceive that beauty is not far from the end.

The order of ascent according to Diotima begins with the beauties of earth and mounts upwards for the sake of that other beauty going from one fair form to all fair forms and from fair forms to fair practices and from fair practices to fair notions until from fair notions we come to the notion of absolute beauty and at last know what the essence of beauty is. This my dear Socrates she concludes, "is the life above all others which man should live in the contemplation of beauty absolute."

For Plotinus the degrees of beauty correspond to degrees of emancipation from matter. The more it goes towards matter the feebler beauty becomes. A thing is ugly only because not dominated by a form and reason the matter has not been completely informed by the idea. If a thing could be completely without reason and form, it would be abso-

siders the distinction between the beautiful and the sublime. We must look for the sublime Kant says not in works of art nor yet in things of nature that in their very concept import a definite end, e.g. animals of a recognized natural order but in rude nature merely as involving magnitude. In company with Longinus and Edmund Burke Kant characterizes the sublime by reference to the limitations of human powers. Whereas the beautiful consists in limitation the sublime immediately involves or else by its presence provokes a representation of limitlessness which may appear indeed in point of form to contravene the ends of our power of judgement to be ill adapted to our faculty of presentation and to be as it were an outrage on the imagination.

Made aware of his own weakness man is dwarfed by nature's magnificence but at that very moment he is also elevated by realizing his ability to appreciate that which is so much greater than himself. This dual mood signalizes man's experience of the sublime. Unlike the enjoyment of beauty it is neither disinterested nor devoid of moral tone.

TRUTH IS USUALLY connected with perception and thought the good with desire and action. Both have been related to love and in different ways to pleasure and pain. All these terms naturally occur in the traditional discussion of beauty partly by way of definition but also partly in the course of considering the faculties engaged in the experience of beauty.

Basic here is the question whether beauty is an object of love or desire. The meaning of my answer will of course vary with different conceptions of desire and love.

Desire is sometimes thought of as fundamentally acquisitive directed toward the appropriation of a good whereas love on the contrary aims at no personal aggrandizement but rather with complete generosity wishes only the well-being of the beloved. In this context beauty seems to be more closely associated with a good that is loved than with a good desired.

Love moreover is more akin to knowledge than is desire. The act of contemplation is sometimes understood as a union with the ob-

ject through both knowledge and love. Here again the context of meaning favors the alignment of beauty with love at least for those which make beauty primarily an object of contemplation. In Plato and Plotinus, and on another level in the theologians the two considerations—of love and beauty—fuse together inseparably.

It is the privilege of beauty Plato thinks to offer man the readiest access to the world of ideas. According to the myth in the *Phaedrus* the contemplation of beauty enables the soul to grow wings. This experience ultimately intellectual in its aim is described by Plato as identical with love.

The observer of beauty is amazed when he sees anyone having a godlike face or form which is the expression of divine beauty and at first a shudder runs through him and again the old awe steals over him, then looking upon the face of his beloved is of a god he reveres him and if he were not afraid of being thought a downright madman he would sacrifice to his beloved as to the image of a god. When the soul bathes herself in the waters of beauty her constraint is loosened and she is refreshed and has no more pangs and pains. This state of the soul entranced by beauty Plato goes on to say is by men called love.

Sharply opposed to Plato's intellectualization of beauty is that conception which connects it with sensual pleasure and sexual attraction. When Darwin for instance considers the sense of beauty he confines his attention almost entirely to the colors and sounds used as attractions of the opposite sex. Freud likewise, while admitting that psycho analysis has less to say about beauty than about most things claims that its derivation from the realms of sexual sensation seems certain.

Such considerations may not remove beauty from the sphere of love but as the chapter on Love makes clear love has many meanings and is of many sorts. The beautiful which is sexually attractive is the object of a love which is almost identical with desire—sometimes with lust—and certainly involves animal impulses and bodily pleasures. The taste for the beautiful writes Darwin at least as far as female beauty is concerned is not of a special nature in the human mind.

## REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in *Aristotle's Psychology* 116a 219b, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

**I or Secunda.** 5 When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in *Saints Psychology* 116a 219b, the passage begins in the upper half of page 126 and ends in the lower half of page 129. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page. For example, in *Plato's Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

**Author + Date.** 10 In One or more of the main divisions of a work (such as PART, etc., etc.) are sometimes included the date of publication, in brackets, or the name of the author, in certain cases e.g. *Lyd.*, KII [1-6], 283[1] 12d.

**By the References.** The references relate to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows e.g. Old Test. Mt. 7:10; Jn. 7:15-(D) II Esdras, 46.

**Strikes.** The strike-through "exp" calls the reader's attention to one or more especially relevant part of a whole reference; passage signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanations of Reference Style for general guidance in the use of *The Great Ideas*; consult the Preface.

lute ugliness. But whatever exists possesses form and reason to some extent and has some share of the effulgent beauty of the One even as it has some share through emanation in its overflowing being—the grades of beauty as of being signifying the remotion of each thing from its ultimate source.

Even separated from a continuous scale of beauty the extreme terms—the beauty of God and the beauty of the least of finite things—have similitude for a theologian like Aquinas. The word *vismus* in his definition of the beautiful (*id quod visum placet* that which pleases upon being seen) is the word used to signify

the type of supernatural knowledge promulgated to the souls of the blessed—the beatific vision which God is beheld intuitively, not known discursively and in which knowledge united with love is the principle of the soul's union with God.

An analogy is obviously implied. In this life and on the natural level every experience of beauty—in nature or art in sensible things or in ideas—occasions something like an act of vision, a moment of contemplation of enjoyment detached from desire or action and clear without the articulations of analysis or the demonstrations of reason.

### OUTLINE OF TOPICS

1 The general theory of the beautiful	11
1a The beautiful and the good beauty as a kind of fitness or order	11
1b Beauty and truth the beautiful as an object of contemplation	12
1c The elements of beauty unity proportion clarity	12
1d The distinction between the beautiful and the sublime	12
2 Beauty in nature and in art	13
3 Beauty in relation to desire and love as object or cause	13
4 Beauty and ugliness in relation to pleasure and pain	13
5 Judgments of beauty the objective and the subjective in aesthetic judgments or judgments of taste	14
6 The role of the beautiful in education	14
7 Intelligible beauty	15
7a The beauty of God	15
7b The beauty of the universe	15
7c Beauty in the order of ideas	15

## Chapter 7 BEING

### INTRODUCTION

THE words *is* and *(is) not* are probably the words most frequently used by anyone. They are unavoidable by implication at least in every statement. They have in addition a greater range of meaning than any other words.

Their manifold significance seems to be of a very special kind for whatever is said *not to be* in one sense of being can always be said *to be* in another of its senses. Children and practiced hars know this. Playing on the meanings of *being* or *with is* and *not* they move smoothly from fact to fiction, imagination to reality, or truth to falsehood.

Despite the obviousness and commonplace ness of the questions which arise with any con sideration of the meanings of *is* the study of *being* is a highly technical inquiry which only philosophers have pursued at length. Berkeley gives one reason why they cannot avoid this task. Nothing seems of more importance he says towards erecting a firm system of sound and real knowledge than to lay the begin ning in a distinct explication of what is meant by *thing reality existence* for in vain shall we dispute concerning the real existence of things or pretend to any knowledge thereof so long as we have not fixed the meaning of those words.

In the whole field of learning philosophy is distinguished from other disciplines—from his tory, the sciences and mathematics—by its concern with the problem of *being*. It alone asks about the nature of *existence*, the modes and properties of *being*, the difference between *being* and *becoming*, *appearance* and *reality*, the *possible* and the *actual*, *being* and *non being*. Not all philosophers ask these questions nor do all who ask such questions approach or formulate them in the same way. Nevertheless the attempt to answer them is a task peculiar to

philosophy. Though it often leads to subtleties it also keeps the philosopher in deepest touch with common sense and the speculative wonder of all men.

As a TECHNICAL concept in philosophy *being* has been called both the richest and the crue st of all terms in the vocabulary of thought. Both remarks testify to the same fact namely that it is the highest abstraction, the most universal of predicates and the most pervasive subject of discussion.

William James is in that long line of philoso phers which began with the early Greeks when he points out that in the strict and ultimate sense of the word *existence* everything which can be thought of at all exists as some sort of object whether mythical object, individual thinker's object, or object in outer space and for intelligence at large. Even things which do not really exist have being insofar as they are objects of thought—things remembered which once existed, things conceivable which have the possibility of being, things imaginary which have being at least in the mind that thinks them. This leads to a paradox which the ancients delighted in pondering that even nothing is something even non being has been for before we can say non being is not we must be able to say non being is. *Nothing* is at least an object of thought.

Any other word than *being* will tend to classify things. The application of any other name will divide the world into things of the sort denominated as distinct from everything else. Chair, for example, divides the world into things which are chairs and all other ob jects but *being* divides something or any thing from nothing and as we have seen even applies to nothing.

All other names Aquinas writes “are

other less universal, or if convertible with it add something, above it at least in idea hence in a certain way they inform and determine it." The concepts which such words express have therefore a restricted universality. They apply to all things of a certain kind but not to "things" things of every kind or type. With the exception of a few terms inseparably associated with being (as Aquinas says, convertible with it) only being is common to all kinds of things. When every other trait peculiar to a thing is removed its being remains—the fact that it is in some sense.

If we start with a particular of any sort classifying it progressively according to the characteristics which it shares with more and more things, we come at last to being. According to this method of abstraction which Hegel follows in his *Science of Logic*, being is the emptiest of terms precisely because it is the commonest. It signifies the very least that can be thought of anything. On this view if all we are told of something is that it is—that it has being—we learn as little as possible about the thing. We have to be told that a thing is a material or a spiritual being, a real or an imaginary being, a living or a human being, in order to apprehend a determinate nature. Abstracted from every thing else, being has only the positive meaning of excluding non-being.

There is an opposite procedure by which the term being has the maximal rather than the minimal significance. Since whatever else a thing is, it is a being, is being lies at the very heart of its nature and underlies all its other properties. Being is indeterminate only in the sense that it takes on every sort of determination. Wherever being is found by thought it is understood as a determined mode of being. To take a being in this way we do not remove the very difference or determination, but on the contrary embrace all since all are differences or determinations of being.

Aquinas, for example conceives being taken simply as including all perfections of being," and in the Judeo-Christian tradition, being without qualification is taken as the most proper name for God. When Moses asked God His name he received as answer "I AM THAT I AM." Thus shalt thou say unto the children of Israel, "I AM hath sent me unto you." Used

in this sense being becomes the richest of terms—the one which has the greatest amplitude of meaning.

Both ways of thinking about being are relevant to the problem of the relations among the various meanings of being. Both are also related to the problem of whether being is one or many—the problem first raised by the Eleatics, exhaustively explored in Plato's *Parmenides* and recurrent in the thought of Plotinus, Spinoza and Hegel.

The two problems are connected. If everything that exists only as a part of being as a whole or if the unity of being requires everything to be the same in being, then whatever diversities there are do not multiply the meanings of being. Although he speaks of substance rather than of being, Spinoza argues that there cannot be any substance excepting God and consequently none other can be conceived. From this it follows that whatever is, is in God and nothing can be or be conceived without God.

Since there cannot be two or more substances of the same nature or attribute and since God is defined as a substance consisting of infinite attributes, each one of which expresses eternal and infinite essence" it is absurd in Spinoza's opinion to think of any other substance. If there were any substance besides God it would have to be explained he says, "by some attribute of God and thus two substances would exist possessing the same attribute which is impossible."

Spinoza's definition of substance attribute and mode or affection, combined with his axiom that every thing which is, is either in itself or in another enables him to embrace what ever multiplicity or diversity he finds in the world as aspects of one being. Everything which is not substance existing in and of itself exists in that one substance as an infinite attribute or a finite mode. The thing extended (*res extensa*) and the thinking thing (*res cogitans*) he writes, are either attributes of God or affections of the attributes of God.

If, on the contrary, there is no unitary whole of being, but only a plurality of beings which are alike in being and yet are diverse in being from one another then our conception of being

must involve a system of meanings a stem of many branches Descartes for example distinguishes between an infinite being whose essence involves its existence and finite beings which do not necessarily exist of themselves but must be caused to exist The infinite being which is God causes but does not contain within itself other finite substances and among finite things Descartes holds 'two substances are said to be really distinct when each of them can exist apart from the other'

In addition to God—that substance which we understand to be supremely perfect—Descartes defines two kinds of finite substance

That substance in which thought immediately resides I call Mind he writes and that substance which is the immediate subject of extension in space and of the accidents that presuppose extension e.g. figure situation movement in space etc. is called Body All these substances and even their accidents have being but not being of the same kind or to the same degree There are according to Descartes diverse degrees of reality or (the quality of being an) entity For substance has more reality than accident or mode and infinite substance has more than finite substance Its being is independent theirs dependent

The issue between Spinoza and Descartes—a single substance or many—is only one of the ways in which the problem of the unity or diversity of being presents itself Both Plato and Aristotle for example affirm a multiplicity of separate existences but though both are in this sense pluralists being seems to have one meaning for Plato many for Aristotle

According to Plato's distinction between being and becoming only the immutable essences the eternal ideas are beings and though they are many in number they all belong to one realm and possess the same type of being But for Aristotle not only do perishable as well as imperishable substances exist not only is there sensible and mutable as well as immaterial and eternal being but the being which substances possess is not the same as that of accidents essential is not the same as accidental being potential being is not the same as being actual and to be is not the same as to be conceived that is to exist in reality is not the same as to exist in mind

Again and again Aristotle insists that there are many senses in which a thing is said to be

Some things are said to be because they are substances others because they are affects of substance others because they are in process towards substance or destructions or mutations or qualities of substance or productive or generative of substance or of things which are relative to substance or negations of one of these things or of substance itself It is for this reason he continues that we say even of non being that it is non being and in another place he adds that besides all these there is that which is potentially or actually

All these senses of being according to Aristotle refer to one starting point namely substance or that which has being in and of itself That which is primarily *re* not in a qualified sense he writes must be a substance But when he also says that that which is primarily *is* the what which indicates the substance of a thing he seems to be using the words substance and essence interchangeably This in turn seems to be related to the fact that although Aristotle distinguishes between actual and potential being and between necessary or incorruptible and contingent or corruptible beings he like Plato and unlike Aquinas Descartes or Spinoza does not consider whether the essence and existence of a being are identical or separate

It may be held that this distinction is implied since a contingent being is one which is able not to exist whereas a necessary being cannot not exist A contingent being is therefore one whose essence can be divorced from existence a necessary being one which *must* be precisely because its essence is identical with its existence But the explicit recognition of a real distinction between essence and existence seems to be reserved for the later theologians and philosophers who conceive of an infinite being as Aristotle does not

The infinity of a being lies not only in its possession of all perfections but even more fundamentally in its requiring no cause outside itself for its own existence That thing said Aquinas whose being differs from its essence must have its being caused by another That which has being but is not being is a being by participation Where Aristotle makes sub-

Since the primary type of being and the starting point of all its other meanings, Aquinas makes the infinite being of God those very essence it is to be the source of all finite and participated beings in which there is a composition of existence and essence or of that whereby they are and that which they are.

Since being itself is that whereby a thing is, being belongs to God primarily and to all other things according to modes of derivation or participation. God and his creatures can be called beings but Aquinas points out not in the identically same sense nor yet with utter diversity of meaning. A similarity—a sameness in diversity or analogy—obtains between the unqualified being of God and the being of all other things which have being subject to various qualifications or limitations.

All other questions about being are affected by the solution of these basic problems concerning the unity of being, the kinds of being and the order of the various kinds. If they are solved in one way—in favor of unity—certain questions are not even raised for they are genuine only on the basis of the other solution which finds being diverse. The discussion in the chapters on SAME AND OTHER, and on SICK & SO SICKER, of sameness, diversity and analogy is, therefore, relevant to the problem of how things are at once alike and unlike in being.

THE GREEKS NOTABLY Plato and Aristotle, began the inquiry about being. They realized that after all other questions are answered there still remains the question: What does it mean to say of anything, that it is or is not? After we understand what it means for a thing to be a man, or to be alive, or to be a body we must still consider what it means for that thing simply to be in any way at all or to be in one sense and not to be in another.

The discussion of being in itself and in relation to unity and truth rest and most often runs through many dialogues of Plato. It is central in the *Sophist* and *Parmenides*. The same terms and problems appear in Aristotle's scientific treatise which makes being its distinctive subject matter and which he sometimes calls first philosophy and sometimes theology. It belongs to this science he declares to consider

being, *qua* being—both what it is and the properties which belong to it *qua* being.

As pointed out in the chapter on Metaphysics it is an historical accident that this inquiry concerning being came to be called metaphysics. That is the name which according to legend the ancient editors gave to a collection of writings in which Aristotle pursued this inquiry. Since they came after the books on physics they were called *meta* physics on the supposition that Aristotle intended the discussion of being to follow his treatise on change and motion.

If one were to invent a word to describe the science of being it would be ontology—not metaphysics or even theology. Yet metaphysics has remained the traditionally accepted name for the inquiry or science which goes beyond physics—or all of natural science—in that it asks about the very existence of things, and their modes of being. The traditional connection of metaphysics with theology discussed in the chapters on TRINITY and METAPHYSICS seems to have its origin in the fact that Aristotle's treatise on being passes from a consideration of sensible and mutable substances to the problem of the existence of immaterial beings and to the conception of a divine being purely actual absolutely immutable.

In a science intended to treat of that which is primarily and to which all the other categories of being are referred namely substance Aristotle says we must first sketch the nature of substance. Hence he begins with what he calls the generally recognized substances. These are the sensible substances. He postpones until later his critical discussion of the ideas and the objects of mathematics, for some say these are substances in addition to the sensible substances yet he directs his whole inquiry to the ultimate question whether there are or are not any besides sensible substances. His attempt to answer this question in the twelfth book makes it the theological part of his Metaphysics.

THOUGH THEIR ORDER of discussion is different the metaphysicians of the 17th century like Descartes, Spinoza and Leibnitz, deal with many if not all major points in the analysis of being, who it the Greek philosophers ini-

ated and the mediaeval theologians developed. Later philosophers whose main concern is with the origin and validity of human knowledge come to the traditional metaphysical questions through an analysis not of substance or essence existence or power but of our *ideas* of substance and power.

This transformation of the ancient problem of being is stated by Berkeley in almost epigrammatic form. Considering what is meant by the term *exist*, he argues from the experience of sensible things that their *esse* is *perception*; nor is it possible they should have any existence out of the minds or thinking things which perceive them. Locke too although he does not identify being with perception makes the same shift on the ground that the first step towards satisfying several inquiries the mind of man was apt to run into was to make a survey of our own understandings examine our own powers and see to what things they were adapted.

Once the problems of being are viewed first in terms of the mind the questions for the philosopher become primarily those of the relation of our definitions to real and nominal essences the conditions of our knowledge of existence and the identification of the real and ideal with perceptible matters of fact and intelligible relations between ideas.

For Kant the basic distinction is between the sensible and supra sensible or the phenomenal and noumenal realms of being. From another point of view Kant considers the being of things *in themselves apart from human experience* and the being of natural things or what is the same for him the things of experience. The former are unconditioned the latter conditioned by the knowing mind which is formative or constitutive of experience.

The sole aim of pure reason Kant writes is the absolute totality of the synthesis on the side of the conditions in order to preposit the whole series of conditions and thus present them to the understanding *a priori*. Having obtained these conditions we can ascend through them until we reach the unconditioned that is the principles. It is with these ideas of pure reason that metaphysics according to Kant properly deals. Instead of being its object consists in three grand ideas God

Freedom and Immortality and it aims at showing that the second conception conjoined with the first must lead to the third as a necessary conclusion.

Hegel on the other hand does not approach the problem of being or reality through a critique of knowledge. For Hegel as for Plotinus before him the heart of metaphysics lies in understanding that nothing is actual except the Idea or the Absolute and the great thing is to apprehend in the show of the temporal and the transient the substance which is imminent and the eternal which is present. Plotinus calls the absolute not the Idea but the All one yet he tries to show that the One is the principle the light and the life of all things just as Hegel reduces everything to a manifestation of the underlying reality of the Absolute Idea.

Despite all such changes in terminology despite radical differences in philosophical principle or conclusion and regardless of the attitude taken toward the possibility of metaphysics as a science the central question which is faced by anyone who goes beyond physics or natural philosophy is a question about being or existence. It may or may not be asked explicitly but it is always present by implication.

The question about God for example of free will or immortality is first of all a question about whether such things *exist* and how they exist. Do they have reality or are they only fictions of the mind? Similarly questions about the infinite the absolute or the unconditioned are questions about that primary reality apart from whose existence nothing else could be or be conceived and which therefore has an existence different from the things dependent on it for their being. Here again the first question is whether such a reality exists.

Enough has been said to indicate why the discussion cannot consider all topics which have some connection with the theory of being. To try to make this Introduction adequate even for the topics outlined here under which the references to the great books are assembled would be to make it almost co-extensive in scope with the sum of many other Introductions—all in fact which open chapters dealing with metaphysical concepts or problems.

It is to be expected of course that the special

I the existence of God, of an immor-  
d of a free will should be treated in  
n on God IMMORTALITY and WILL,  
/ nor be realized that such chapters  
*EVER ITY FORM, I FINITS IDEA*

*D E AND MANY SAME AND OTHER,*  
UNIVERSAL AND PARTICULAR—all  
still others cited in the Cross Refer-  
w—include topics which would have  
used here if we were to try to cover  
it considerations.

of economy and intelligibility due  
opposite course Limiting the scope of  
duction to a few principal points in  
ry of being, we can also exhibit  
the relation of this chapter to others,  
connection of the great ideas. The var-  
ies of being (such as essence and exist-  
stance and accident, potentiality and  
the real and the ideal) and the basic  
ries of being (such as unity, goodness,  
etc., therefore left for fuller treatment  
contexts. But two topics deserve men-  
tion here. One is the distinction between  
being and becoming; the other the rela-  
tion to knowledge.

IT OF CHANGE or motion—of coming to  
being away—is so evident to the senses  
as never been denied, at least not as an  
aced phenomenon. But it has been re-  
garded as irrational and unreal, an illusion per-  
ceived by the senses. Galen, for instance,  
the Sophists with allowing that bread  
turning into blood becomes changed, re-  
jects taste and touch, but denying  
that change occurs in reality. They ex-  
plain it as tricks and illusions of  
senses which are affected now in one  
way in another whereas the underlying  
reality does not admit of any of these  
explanations.

familiar paradoxes of Zeno are reducible  
to arguments to show that motion is  
impossible, full of self contradiction. The way  
is, according to Iarmendes, Zeno's mas-  
ter, the Eleatic school, lies in the insight that  
either always was and will be, that nothing  
comes into being out of non-being, or  
out of being into nothingness.  
The doctrine of Parmenides provoked many

criticisms. Yet his opponents tried to preserve  
the reality of change without having to accord  
it the fullness of being. The Greek atomists, for  
example think that change cannot be explained  
except in terms of permanent beings—in fact  
eternal ones. Lucretius, who espounds their  
views, remarks that in any change something  
unchangeable must remain over that all things  
be not utterly reduced to nothing for when  
ever a thing changes and quits its proper limits,  
at once this change of state is the death of that  
which was before. The something unchange-  
able is thought to be the atom, the absolutely  
indivisible, and hence imperishable unit of  
matter. Change does not touch the being of the  
atoms, but only breaks up the union among  
them, and then joins anew the different ele-  
ments with others and thus it comes to pass  
that all things change—that is, all things com-  
pose not the simple bodies of solid singleness  
—when the clashings, motions, arrangement  
position, and shapes of matter change about.

In a conversation with Cratylus, who favors  
the Heraclitean theory of a universal flux Socrates asks  
How can there be a real thing which  
is never in the same state? How can we  
reasonably say Cratylus, he goes on that  
there is any knowledge at all, if every thing is in  
a state of transition and there is nothing  
abiding?

When he gets Glaucon to admit in the *Repub-*  
lic that being is the phere or subject matter of  
knowledge and knowing, is to know the nature  
of being. Socrates leads him to see the correla-  
tion of being, not being, and becoming with  
knowledge, ignorance and opinion. If opinion  
and knowledge are distinct faculties then the  
phere of knowledge and opinion cannot be the  
same. If being is the subject matter of  
knowledge something else must be the subject  
matter of opinion. It cannot be not being for  
of not being ignorance was assumed to be the  
necessary correlative.

Since opinion is not concerned either with  
being or with not being because it is obviously  
intermediate between knowledge and ignor-  
ance, Socrates concludes that if anything ap-  
peared to be of a sort which is and is not at the  
same time that sort of thing would appear also  
to lie in the interval between pure being and  
absolute not being and the corresponding

ated and the mediaeval theologians developed. Later philosophers whose main concern is with the origin and validity of human knowledge come to the traditional metaphysical questions through an analysis not of substance or essence existence or power but of our *ideas* of substance and power.

This transformation of the ancient problem of being is stated by Berkeley in almost epigrammatic form. Considering what is meant by the term *exist*, he argues from the experience of sensible things that their *esse* is *percipi*, nor is it possible they should have any existence out of the minds or thinking things which perceive them. Locke too although he does not identify being with perception makes the same shift on the ground that the first step towards satisfying several inquiries the mind of man was apt to run into was to make a survey of our own understandings examine our own powers and see to what things they were adapted.

Once the problems of being are viewed first in terms of the mind the questions for the philosopher become primarily those of the relation of our definitions to real and nominal essences the conditions of our knowledge of existence and the identification of the real and ideal with perceptible matters of fact and intelligible relations between ideas.

For Kant the basic distinction is between the sensible and supra sensible or the phenomenal and noumenal realms of being. From an other point of view Kant considers the being of things in themselves apart from human experience and the being of natural things or what is the same for him the things of experience. The former are unconditioned the latter conditioned by the knowing mind which is formative or constitutive of experience.

The sole aim of pure reason Kant writes is the absolute totality of the synthesis on the side of the conditions in order to preposit the whole series of conditions and thus present them to the understanding *a priori*. Having obtained these conditions we can ascend through them until we reach the unconditioned that is the principles. It is with these ideas of pure reason that metaphysics according to Kant properly deals. Instead of *being* its object consists in three grand ideas God

Freedom and Immortality and it aims at showing that the second conception conjoined with the first must lead to the third as a necessary conclusion.

Hegel on the other hand does not approach the problem of being or reality through a critique of knowledge. For Hegel as for Plotinus before him the heart of metaphysics lies in the understanding that nothing is actual except the Idea or the Absolute and the great thought is to apprehend in the show of the temporal and the transient the substance which is immaterial and the eternal which is present. Plotinus calls the absolute not the Idea but the All one yet he tries to show that the One is the principle the light and the life of all things just as Hegel reduces everything to a manifestation of the underlying reality of the Absolute Idea.

Despite all such changes in terminology despite radical differences in philosophical principle or conclusion and regardless of the attitude taken toward the possibility of metaphysics as science the central question which is faced by anyone who goes beyond physics or natural philosophy is a question about being or existence. It may or may not be asked explicitly but it is always present by implication.

The question about God for example or free will or immortality is first of all a question about whether such things exist and how they exist. Do they have reality or are they only fictions of the mind? Similarly questions about the infinite the absolute or the unconditional are questions about that primary reality apart from whose existence nothing else could be conceived and which therefore has an existence different from the things dependent on it for their being. Here again the first question is whether such a reality exists.

Enough has been said to indicate why this discussion cannot consider all topics which have some connection with the theory of being. To try to make this Introduction adequate even for the topics outlined here under which the references to the great books are assembled would be to make it almost co-extensive in scope with the sum of many other Introductions—all in fact which open chapters dealing with metaphysical concepts or problems.

It is to be expected of course that the speci-

adds Plato was in a sense not wrong in sophistic as dealing with that which or the arguments of the sophists deal say above all with the accidental & accidental is akin to non being & thinks may be seen in the fact that which are in another sense come into & pass out of being by a process but which are accidentally do not But he rejects the accidental as an object of he does not like Plato or Plotinus, ex he whole realm of sensible changing from the phe of scientific knowledge in both metaphysics and physics treat of substances the one with regard to their being the other with regard to their mutability—their becoming or changing Plotinus on the other hand the true is have an intelligible object and contain ion of anything sensible They are di not to variable things suffering from is of changes di ded in space to which one of becoming and not being belongs & the eternal being which is not divided ng always in the same way which is not and does not perish and has neither space nor situation but rests immovable in

according to another view represented by substance is as such unknowable whether be body or spirit We use the word substance to name the support of such qualities that are capable of producing simple ideas in which qualities are commonly called accidents. The sensible accidents are all that we know and we give the general name substance to the supposed but unknown support of those qualities we find existing Some these sensible accidents are what Locke calls unary qualities—the powers or potentialities by which things affect one another and also

But to the extent that our senses fail to dis ter the bulk texture and figure of the ma terials of bodies on which their constitu ions and differences depend we are fai to the use of their secondary qualities, as the tactistical notions and marks whereby to some ideas of them in our mind. Neverthe less powers—which are qualities or accidents of substances—seem to be for Locke the

ultimate reality we can know The secondary sensible qualities he writes are nothing but the powers which corporeal substances have to produce several ideas in us by our sense which ideas—unlike the primary qualities—are not in the things themselves otherwise than as anything is in its cause

Hobbes exemplifies still another view A man can have no thought he says represent ing anything not subject to sense. Hobbes does not object to calling bodies substances but thinks that when we speak of an incorporeal body or (which is all on) an incorporeal substance we talk nonsense for none of these things ever have or can be incident to sense but are absurd speeches taken upon credit (without any signification at all) from deceived Philosophers and deceited or deceiving Schoolmen.

He enumerates other absurdities, such as the giving of names of bodies to accidents or of accidents to bodies e.g. by those who say that extension is body Criticism of the fallacy of reification—the fallacy first pointed out by Ockham and criticized so repeatedly in contemporary semantics—also appears in Hobbes warning against making substances out of abstractions or universals by giving the names of bodies to names or predicates.

WHENEVER A THEORY of knowledge is concerned with how we know reality as opposed to mere appearance it considers the manner in which existing beings can be known—by perception intuition or demonstration and with respect to demonstration it attempts to formulate the conditions of valid reasoning about matters of fact or real existence. But it has seldom been supposed that reality exhausts the objects of our thought or knowledge We can conceive possibilities not realized in this world We can imagine things which do not exist in nature

The meaning of reality—of real as opposed to purely conceptual or ideal being—is derived from the notion of thinghood of having being outside the mind not merely in it In traditional controversies about the existence of ideas—or of universals the objects of mathematics or relations—it is not the being of such things which is questioned but their reality their existence outside the mind If, for example

faculty is neither knowledge nor ignorance but will be found in the interval between them. This intermediate flux or sphere of becoming this region of the many and the variable can yield only opinion. Being the realm of the 'absolute and eternal and immutable [Ideas] is the only object that one may be said to know.'

Aristotle would seem to agree with Plato that change partakes equally of the nature of being and not being and cannot rightly be termed either pure and simple. He points out that his predecessors particularly the Eleatics held change to be impossible because they believed that what comes to be must do so either from what is or from what is not both of which are impossible. It is impossible so they argued since what is cannot come to be (because it is already) and from what is not nothing could have come to be. Aristotle concedes the cogency of this argument on one condition namely that the terms being and not being are taken without qualification. But his whole point is that they need not be taken with out qualification and should not be if we wish to explain change rather than make a mystery of it.

The qualification Aristotle introduces rests on the distinction between two modes of being—the potentiality and actuality correlative with matter and form. This makes it possible for him to maintain that a thing may come to be from what is not in a qualified sense. He illustrates his meaning by the example of the bronze which from a mere lump of metal comes to be a statue under the hands of the artist. The bronze he says was potentially a statue and the change whereby it came to be actually a statue is the process between potentiality and actuality. While the change is going on the bronze is neither completely potential nor fully actual in respect of being a statue.

Like Plato Aristotle recognizes that there is something indefinite about change. The reason he explains is that it cannot be classed simply as a potentiality or as an actuality—a thing that is merely capable of having a certain size is not undergoing change nor yet a thing that is actually of a certain size. Change is a sort of actuality but incomplete hard to grasp but not incapable of existing.

If to exist is to be completely actual the changing things and change itself do not exist. They exist only to the extent that they have actuality. Yet potentiality no less than actuality is a mode of being. That potentiality—power or capacity—belongs to being seen also to be affirmed by the Eleatic Stranger. Plato's *Sophist*. Anything which possesses a sort of power to affect another or to be affected by another he says is only for a single moment however trifling the cause and however slight the effect has real existence. I hold he adds that the definition of being is simple power.

The basic issue concerning being and becoming and the issue concerning eternal as opposed to mutable existence recur again and again in the tradition of western thought. They are involved in the distinction between corruptible and incorruptible substances (which is in turn connected with the division of substances into corporeal and spiritual) and with the nature of God as the only purely actual or truly eternal being. They are implicit in Spinoza's distinction between *natura naturans* and *natura naturata* and in his distinction between God's knowledge of things under the aspect of eternity and man's temporal view of the world process. They are relevant to Hegel's Absolute Idea which while remaining fixed progressive reveals itself in the ever changing face of nature and history. In our own day these issues enter Dewey, Santayana, and Whitehead in controversy as yesterday they engaged Bradley, William James, and Bergson.

As ALREADY NOTED Plato's division of reality into the realms of being and becoming has bearing on his analysis of knowledge and of opinion. The division relates to the distinction between the intelligible and the sensible and between the opposed qualities of certainty and probability or necessity and contingency in our judgments about things. The distinction between essence and existence and between substance and accident separate aspects of modes of being which function differently in objects for the knowing mind.

Aristotle for example holds that there can be no scientific treatment of the accidental for the accidental is practically a mere name.

## CHAPTER 7 BEING

135

PAGE

139

· Being and truth	
42. Being as the pervasive object of mind, and the formal object of the first philosophy, metaphysics, or dialectic	140
43. Being as the measure of truth in judgments of the mind: clarity and distinctness as criteria of the reality of an idea	
44. Being and becoming: the reality of change: the nature of mutable being	
5. The cause of existence	141
6. The divisions or modes of being	142
a. The distinction between essence and existence: existence as the act of being	
b. The distinction between substance and attribute, accident or modification: independent and dependent being	
(i) The conceptions of substance	143
(ii) Corporeal and spiritual substances, composite and simple substances: the kinds of substance in relation to matter and form	
(iii) Corruptible and incorruptible substances	144
(iv) Extension and thought as dependent substances or as attributes of infinite substance	
(v) Substance as subject to change and to different kinds of change: the rate of accidents or modifications	145
(vi) The nature and kinds of accidents or modifications	
c. The distinction between potentiality and actuality: possible and actual being	146
(i) The order of potentiality and actuality	
(ii) Types of potency and degrees of actuality	
(iii) Potentiality and actuality in relation to matter and form	147
d. The distinction between real and ideal being, or between natural being and being in mind	
(i) The being of the possible	148
(ii) The being of ideas, universals, rights	
(iii) The being of mathematical objects	149
(iv) The being of relations	
(v) The being of fictions and negations	150
e. The distinction between appearance and reality: between the sensible and supersensible; between the phenomenal and noumenal orders	
· Being and knowledge	
&. Being and becoming in relation to sense perception and imagination	
&2. Being and becoming in relation to intellect: abstraction and intuition	151
&3. Essence or substance as the object of definition: real and nominal essences	
&4. The role of essence in demonstration: the use of essence, property and accident in inference	
&5. The accidental in relation to science and division	152
&6. Judgments and demonstrations of existence: their sources and auditory	

ideas exist apart from minds the minds of men and God they have real not ideal existence If the objects of mathematics such as numbers and figures have existence only as figments of the mind they are ideal beings

The judgment of the reality of a thing James thinks involves a state of consciousness *sui generis* about which not much can be said in the way of internal analysis The focus of this problem in modern times is indicated by James phrasing of the question Under what circumstances do we think things real? And James gives a typically modern answer to the question

He begins by saying that any object which remains uncontradicted is ipso facto believed and posited as absolute reality He admits that for most men the things of sense are the absolutely real world's nucleus Other things James writes may be real for this man or that—things of science abstract moral relations things of the Christian theology or what not But even for the special man these things are usually real with a less real reality than that of the things of sense But his basic conviction is that our own reality that sense of our own life which we at every moment possess is the ultimate of ultimates for our belief As sure as I exist! —this is our utter most warrant for the being of all other things As Descartes made the indubitable reality of the *cogito* go bail for the reality of all that the *cogito* involved so all of us feeling our own present reality with absolutely coercive force ascribe an all but equal degree of reality first to whatever things we lay hold on with a sense of

personal need and second to whatever finite things continuously belong with these

The self or ego is the ultimate criterion of being or reality The world of living reality is as contrasted with unrealities James writes is thus anchored in the Ego That is the hook from which the rest dangles the absolute support And as from a painted hook it has been said that one can only hang a painted chain so conversely from a real hook only a real chain can properly be hung Whatever they have intimate and continuous connection with my life are things of whose reality I cannot doubt Whatever things fail to establish this connection are things which are practically no better for me than if they existed not at all James would be the first to concede to any critic of his position that its truth and good sense depend upon noting that word practically for it is the world of practical realities with which he professes to be concerned

WE CAN IN CONCLUSION observe one obvious measure of the importance of being in philosophical thought The major *isms* by which the historians of philosophy have tried to classify its doctrines represent affirmations or denials with respect to being or the modes of being They are such antitheses as realism and idealism materialism and spiritualism monism and pluralism even atheism and theism Undoubtedly no great philosopher can be so simply boxed Yet the opposing *isms* do indicate the great speculative issues which no mind can avoid if it pursues the truth or seeks the ultimate principles of good and evil

## OUTLINE OF TOPICS

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad* BK II [265-283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS** One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers, in brackets are given in certain cases e.g. *Iliad* BK II [265-283] 12d

**BIBLE REFERENCES** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows e.g. OLD TESTAMENT *Nehemiah* 7:45-(D) II *Esdras* 7:46

**SYMBOLS** The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. Passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

## REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad* BK II [265 283] 12d, the number 4 is the number of the volume in the set—the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters c and d refer to the upper and lower halves of the left hand side of the page; the letters e and f to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR & DIVISIONS** One or more of the main divisions of a work (such as PART BK CH, SECT) are sometimes included in the reference line numbers in brackets are given in certain cases, e.g. *Iliad* BK II [265-283] 12d.

**BIBLE REFERENCES** The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows, e.g. OLD TESTAMENT *Nehemiah* 7 45—(D) *II Esdras* 7 46.

**SYMBOLS** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference. passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas*; consult the Preface.

## Chapter 8 CAUSE

### INTRODUCTION

EXPLANATION is an innate human tendency. Even philosophers who think that we cannot attain to knowledge of causes get involved in explaining why that is so, "or if their disputes about the theory of causes do not remove the word "because" from the vocabulary of common speech. It is as unavoidable as the word "is." "The impulse to seek causes," says Tolstoy, "is innate in the soul of man."

The question "Why?" remains after all other questions are answered. It is sometimes the only answerable question—unanswerable either in the very nature of the case or because there are some men cannot fathom. Sometimes, as Dante says, man must be content with the *qua* "the know-edge" that something is without knowing why. "Why?" is the one question which it has been deemed the better part of wisdom not to ask, yet it has also been thought the one question which holds the key to wisdom. As Virgil writes in one of his most famous lines, *Fest qui posse ratione cognoscere causas* (Happy the man who has been able to know the causes of things).

The question "Why?" takes many forms and can be answered in many ways. Other knowledge may prove useful in providing the answers. A definition, for example, which tells us what a thing is, may explain why it behaves as it does or why it has certain properties. A narrative, which tells us how something happened by describing a succession of events, may also be part of the total explanation of some event in question.

In other circumstances, a demonstration or a statement of grounds or reasons may be explanatory. "How do you know?" is often a concealed form of the "Why" question. To answer it we may have to give our reasons for thinking that something or other is the case or perhaps

give the genesis of our opinion. Things as direct as a logical demonstration and a piece of autobiography seem to be relevant in account in, for our conclusions as, in accounting for our behavior we may refer to our purposes and to our past.

THE GREEK WORD for cause, from which our English word "etiology" is derived, came into the vocabulary of science and philosophy from the language of the law courts. In its legal sense it was used to point out where the responsibility lay. A suit at law is based upon a cause of action—he who demands redress for an injury suffered is expected to place the blame. The charge of responsibility for wrongdoing—the blame or fault which is the cause for legal redress or punishment—naturally calls for excuses, which may include a man's motives.

In the context of these legal considerations, two different meanings of cause begin to appear. One man's act is the cause of injury to another in the sense of being responsible for its occurrence. If the act was intentional, it probably had a cause in the purpose which motivated it.

These two types of cause appear in the explanations of the historians as well as in trials at law. Herodotus and Thucydides, trying to account for the Persian or the Peloponnesian war enumerate the incidents which led up to the outbreak of hostilities. They cite certain past events as the causes of war—the factors which predisposed the parties toward conflict and even precipitated it. The historians do not think they can fully explain why the particular events became the occasions for war except by considering the hopes and ambitions, or as Thucydides suggests, the fears of the contestants. For the ancient historians at least finding the causes includes a search for the motives

## ADDITIONAL READINGS

Listed below are works not included in *Great Books of the Western World* but relevant to the idea and topics with which this chapter deals. These works are divided into two groups:

- I Works by authors represented in this collection
- II Works by authors not represented in this collection

For the date, place and other facts concerning the publication of the works cited consult the Bibliography of Additional Readings which follows the last chapter of *The Great Ideas*.

xix

The attack on final causes does not at the beginning at least, reject them completely. Bacon, for example divides natural philosophy into two parts, of which one part physics, inquirieth and handleth the material and efficient causes and the other which is metaphysics, handleth the formal and final causes. The error of his predecessor, of which he complains, is their failure to separate these two types of inquiry. The study of final causes is inappropriate in physics, he thinks.

"This mis-placing," Bacon comments, "hath caused a deficiency or at least a great improvidence in the sciences themselves. For the handling of final causes mixed with the rest in physical inquiries, hath intercepted the severe and diligent inquiry of all real and physical causes, and given men the occasion to stay upon these unsatisfactory and specious causes to the great arrest and prejudice of further discovery. On this score he charges Plato, Aristotle, and Cicero with impeding the development of science, not because final causes are not true, and worthy to be inquired being kept within their own province but because their excursions into the limits of physical causes hath bred a vileness and solitude in that tract."

Such statements as "the hairs of the eyelids are for a quickset and fence about the sight, or that the leaves of trees are for protection of the fruit or that the clouds are for wetting of the earth" are in Bacon's opinion unscientific in physics. He therefore praises the mechanical philosophy of Democritus. It seems to him to inquire into the particularities of physical causes better "than that of Aristotle and Plato, whereof both intermixed final causes, the one as a part of theology, the other as a part of logic."

As Bacon's criticisms indicate the attack on final causes in nature raises a whole series of questions. Does every natural change serve some purpose, either for the good of the change, a thing or for the order of nature itself? Is there a plan, analogous to that of an artist which orders the parts of nature, and their action to one another as means to ends? A natural teleology which attributes final causes to everything seems to imply that every natural thing is governed by an indwelling form working toward a definite end, and that the

whole of nature exhibits the working out of a divine plan or design.

Spinoza answers such questions negatively. "Nature has set no end before herself," he declares and all final causes are nothing but human fictions. Furthermore he insists, "that doctrine concerning an end altogether overturns nature. For that which is in truth the cause it considers as the effect, and vice versa." He deplores those who will not cease from asking the causes of causes, until at last you fly to the will of God the refuge of ignorance.

Spinoza denies that God acts for an end and that the universe expresses a divine purpose. He also thinks that final causes are illusory even in the sphere of human action. When we say that having a house to live in was the final cause of this or that house, "we do no more than indicate a particular desire which is really an efficient cause, and is considered as primary because men are usually ignorant of the causes of their desires."

Though Descartes replies to Pierre Gassendi's arguments on behalf of final causality by saying that they should be referred to the efficient cause, his position more closely resembles that of Bacon than of Spinoza. When we behold the uses of the various parts in plants and animals, we may be led to admire "the God who brings these into existence" but that does not imply, he adds, that we can divine the purpose for which He made each thus. And although in *Ethics*, where it is often allowable to employ conjecture, it is at times pious to consider the end which we may conjecture God set before Himself in ruling the universe, certainly in Physics, where every thing should rest upon the surest arguments it is futile to do so.

The elimination of final causes from natural science leads Descartes to formulate Harvey's discoveries concerning the motion of the heart and blood in purely mechanical terms. But Harvey himself as Boyle points out in his *Discussion About the Final Causes of Natural Things*, interprets organic structures in terms of their functional utility and Boyle defends the soundness of Harvey's method—employing final causes—against Descartes.

Guided as it is by the principle of utility or function, Harvey's reasoning about the circula-

which underlie other causes and help to explain how other factors get their causal efficacy

Thucydides explicitly distinguishes these two kinds of causes in the first chapter of his history. After noting that the immediate cause of the war was the breaking of a treaty he adds that the real cause was one which was formally most kept out of sight namely the growth of the power of Athens and the alarm which this inspired in Lacedaemon.

It is sometimes supposed that Thucydides owes his conception of causes to the early medical tradition. That might very well be the case for Hippocrates constantly seeks the natural causes of disease and in his analysis of the various factors involved in any particular disease he tries to distinguish between the predisposing and the exciting causes.

But the classification of causes was not completed in the Athenian law courts or in the Greek interpretation of history or in the early practice of medicine. Causes were also the preoccupation of the pre-Socratic physicists. Their study of nature was largely devoted to an analysis of the principles elements and causes of change. Concerned with the problem of change in general not merely with human action or particular phenomena such as crime war or disease Greek scientists or philosophers from Thales and Anaxagoras to Empedocles Democritus Plato and Aristotle tried to discover the causes involved in any change. Aristotle carried the analysis furthest and set a pattern for all later discussions of cause.

**THE EXPLANATION OF A THING** according to Aristotle must answer all of the queries comprehended under the question why. This question can be answered he thinks in at least four different ways and these four ways of saying why something is the case constitute his famous theory of the four causes.

In one sense he writes that out of which a thing comes to be and which persists is called cause—the material cause. In another sense the form or the archetype is a cause—the formal cause. Again the primary source of the change or coming to rest is a cause—the efficient cause. Again the end or that for the sake of which a thing is done is a cause—the final cause. This he concludes perhaps ex-

hausts the number of ways in which the term cause is used.

The production of works of art to which Aristotle himself frequently turns for example most readily illustrates these four different kinds of causes. In making a shoe the material cause is that out of which the shoe is made—the leather or hide. The efficient cause is the shoemaker or more precisely the shoemaker's acts which transform the raw material into the finished product. The formal cause is the pattern which directs the work; it is in a sense the definition or type of the thing to be made which beginning as a plan in the artist's mind appears at the end of the work in the transformed material as its own intrinsic form. The protection of the foot is the final cause or end—that for the sake of which the shoe was made.

Two of the four causes seem to be less discernible in nature than in art. The material and efficient causes remain evident enough. The material cause can usually be identified as that which undergoes the change—the thing which grows alters in color or moves from place to place. The efficient cause is always that by which the change is produced. It is the moving cause working on that which is susceptible to change e.g. the fire heating the water the rolling stone setting another stone in motion.

But the formal cause is not as apparent in nature as in art. Whereas in art it can be identified by reference to the plan in the maker's mind it must be discovered in nature in the change itself as that which completes the process. For example the redness which the apple takes on in ripening is the formal cause of its alteration in color. The trouble with the final cause is that it so often tends to be inseparable from the formal cause for unless some extrinsic purpose can be found for a natural change—some end beyond itself which the change serves—the final cause or that for the sake of which the change took place is no other than the quality or form which the matter assumes as a result of its transformation.

**THIS SUMMARY** of Aristotle's doctrine of the four causes enables us to note some of the basic issues and shifts in the theory of causation.

reason of which is that matter does not receive form, *sic* in so far as it is moved by an agent for nothing, reduces itself from potentiality to act. But an agent does not move except from the intention of an end. Hence in operation the order of the four causes is final, efficient material, and formal or as Aquinas states it first comes goodness and the end moving the agent to act secondly the action of the agent moving to the form thirdly comes the form.

The theory of causes, as developed by Aristotle and Aquinas, proposes other distinctions beyond that of the four causes such as the difference between the essential cause or the cause *per se* and the accidental or coincidental cause. As indicated in the chapter on CHANCE, it is in terms of coincidental causes that Aristotle speaks of chance as a cause.

A given effect may be the result of a number of efficient causes. Sometimes these form a series, as when one body in motion sets another in motion and that moves a third, or to take an other example, a man is the cause of his grand son only through having begotten a son who later begets a son. In such a succession of causes, the first cause may be indispensable but it is not by itself sufficient to produce the effect. With respect to the effect which it fails to produce unless other causes intervene, it is an accidental cause. In contrast an essential cause is one which, by its operation immediately brings the effect into existence.

Sometimes, however, a number of efficient causes may be involved simultaneously rather than successively in the production of a single effect. They may be related to one another as cause and effect rather than by mere coincidence. One cause may be the essential cause of another which in turn is the essential cause of the effect. When two causes are thus simultaneously related to the same effect, Aquinas calls one the principal and the other the instrumental cause and he gives as an example the action of a workman using wood. The action of the saw causes a shaping of the wood, but it is instrumental to the operation of the principal cause which is the action of the workman using the saw.

These two distinctions—between essential and accidental causes and between principal

and instrumental causes—become of great significance in arguments, metaphysical or theological concerning the cause of causes—a first or ultimate cause. Aristotle's proof of a prime mover for example depends upon the proposition that there cannot be an infinite number of causes for a given effect. But since Aristotle also holds that the world is without beginning or end and that time is infinite, it may be wondered why the chain of causes cannot stretch back to infinity.

If time is infinite a temporal sequence of causes reaching back to infinity would seem to present no difficulty. As Descartes points out you cannot prove that that regresses to infinity is absurd unless you at the same time show that the world has a definite beginning in time." Though it is a matter of their Jewish and Christian faith that the world had a beginning in time, theologians like Maimonides and Aquinas do not think the world's beginning can be proved by reason. They do however think that the necessity of a first cause can be demonstrated and both adopt or perhaps adapt the argument of Aristotle which relies on the impossibility of an infinite regression in causes.

The argument is valid, Aquinas makes clear only if we distinguish between essential and accidental causes. It is not impossible, he says, to proceed to infinity accidentally as regards efficient causes. It is not impossible for man to be generated by man to infinity." But he holds "there cannot be an infinite number of causes that are *per se* required for a certain effect for instance that a stone be moved by a stick, the stick by the hand and so on to infinity. In the latter case it should be observed the cooperating causes are simultaneous and so if there were an infinity of them that would not require an infinite time. The crux of the argument, therefore lies either in the impossibility of an infinite number of simultaneous causes or in the impossibility of an infinite number of causes related to one another as instrumental to principal cause.

Among causes so related Descartes like Aquinas, argues that there must be one first or principal cause. In the case of causes which are so connected and subordinated to one another that no action on the part of the lower is possible without the activity of the higher, e.g. in

tion of the blood—especially its venal and arterial flow in relation to the action of the lungs—appeals to final causes. He remarks upon the need of arguing from the final cause in his work on animal generation. It appears advisable to me he writes to look back from the perfect animal and to inquire by what process it has arisen and grown to maturity, to retrace our steps as it were from the goal to the starting place.

Kant generalizes this type of argument in his *Critique of Teleological Judgement*. No one has ever questioned, he says, 'the correctness of the principle that when judging certain things in nature, namely organisms and their possibility we must look to the conception of final causes.' Such a principle is admittedly necessary even where we require no more than a *guiding thread* for the purpose of becoming acquainted with the character of these things by means of observation. Kant criticizes a mechanism which totally excludes the principle of finality—whether it is based on the doctrine of blind chance of Democritus and Epicurus or the system of fatality he attributes to Spinoza. Physical science he thinks can be extended by the principle of final causes without interfering with the principle of the mechanism of physical causality.

THE TENDENCY TO dispense with final causes seems to prevail however in the science of mechanics and especially in the domain of inanimate nature. Huygens for example defines light as the motion of some sort of matter. He explicitly insists that conceiving natural things in this way is the only way proper to what he calls the true Philosophy in which one concedes the causes of all natural effects in terms of mechanical motions.

Mechanical explanation is distinguished by the fact that it appeals to no principles except matter and motion. The material and the moving (or efficient) causes suffice. The philosophical thought of the 17th century influenced by that century's brilliant accomplishments in mechanics tends to be mechanistic in its theory of causation. Yet being also influenced by the model and method of mathematics thinkers like Descartes and Spinoza retain the formal cause as a principle of demonstration if not of

explanation. Spinoza in fact claims that the reliance upon final causes would have been sufficient to keep the human race in darkness to all eternity, if mathematics which does not deal with ends, but with the essences and properties of forms, had not placed before us another rule of truth.

Nevertheless the tendency to restrict causality to efficiency—a motion producing a motion—gains headway. By the time Hume questions man's ability to know causes the term *cause* signifies only efficiency understood as the energy expended in producing an effect. Hume's doubt concerning our ability to know causes presupposes this conception of cause and effect which asserts that there is some connection between them, some power in the one by which it invariably produces the other. The identification of cause with the efficient type of cause becomes a commonly accepted notion even among those who do not agree with Hume that we are ignorant of the manner in which bodies operate on each other and that their force and energy is entirely incomprehensible to us.

The narrowing of causality to efficiency also appears in the doctrine more prevalent today than ever before that natural science describes, but does not explain—that it tells us *how* things happen but not *why*. If it does not require the scientist to avoid all reference to causes, it does limit him to the one type of causality which can be expressed in terms of sequences and correlations. The exclusion of all causes except the efficient tends furthermore to reduce the causal order to nothing but the relation of cause and effect.

The four causes taken together as the sufficient reason for things or events do not as such stand in relation to an effect in the sense in which an effect is something separable from and externally related to its cause. That way of conceiving causation—as a relation of cause to effect—is appropriate to the efficient cause alone. When the efficient cause is regarded as the only cause having a power proportionate to the reality of its effect the very meaning of cause involves relation to an effect.

In the other conception of causation the causal order relates the four causes to one another. Of the four causes of any change or act the first says Aquinas is the final cause, the

the regular processes of nature still another and of divine causation is presupposed by the tilious belief in supernatural events, such as the elevation of nature by grace and the deva uses from the course of nature which are called miracles. All these considerations, and especially the matter of God's miraculous intervention in the regular course of nature have been subjects of dispute among theologians and philosophers (and sometimes physicists and historians). Some of those who do not deny the existence of a Creator or the divine government of the universe through natural law nevertheless question the need for divine cooperation with the action of every natural cause, or God's intervention in the order of nature.

Throughout these controversies the theory of cause defines the issues and determines the lines of opposing argument. But since other basic notions are also involved in the debate of these issues the further consideration of them is reserved for other chapters especially *God NATURE and WORLD*.

THE DISCUSSION OF CAUSE takes a new turn in modern times. The new issues arise not from different interpretations of the principle of causality but from the skeptic's doubts concerning our ability to know the causes of things, and from the tendency of the physical sciences to limit or even to abandon the investigation of causes.

According to the ancient conception of science, knowledge to be scientific must state the causes of things. The essence of scientific method according to the *Posterior Analytics* of Aristotle, consists in using causes both to define and to demonstrate. Sometimes genus and difference are translated into material and formal cause; sometimes a thing is defined genetically by reference to its efficient cause and sometimes teleologically by reference to its final cause.

The degree to which this conception of science is realized in particular fields may be questioned. The treatises of the astronomers for example do not seem to exemplify it as much as do Aristotle's own physical treatises or Harvey's work on the circulation of the blood. Yet until modern developments in mathematical physics, the ascertainment of causes seems to be the dominant conception of the scientific task.

and until the separation widens between the experimental and the philosophical sciences the possibility of knowing causes is not generally doubted.

Galileo's exposition of the new mechanics explicitly announces a departure from the traditional interest of the natural philosopher in the discovery of causes. The aim he says in his *Two New Sciences* is not to investigate the cause of the acceleration of natural motion concerning which various opinions have been expressed by various philosophers but rather to investigate and to demonstrate some of the properties of accelerated motion. The various opinions about causes are referred to as fantasies which it is not really worth while for the scientist to examine.

This attitude toward causes especially efficient causes characterizes the aim of mathematical physics both in astronomy and mechanics. For Newton it is enough—in fact he says it would be a very great step in philosophy—to derive two or three general principles of motion from phenomena, though the causes of those principles were not yet discovered. And therefore I scruple not to propose the principles of motion and leave their causes to be found out. In other passages Newton disparages the search for hidden or occult causes as no part of the business of science.

Hume goes further. He insists that all causes are hidden. By the very nature of what causes are supposed to be and because of the manner in which the human mind knows, man can have no knowledge of how causes really produce their effects. We never can by our utmost scrutiny discover anything but one event following another without being able to comprehend any force or power by which the cause operates or any connexion between it and its supposed effect.

All that men can be referring to when they use the words cause and effect Hume thinks is the customary sequence of one object followed by another and where all objects similar to the first are followed by objects similar to the second. So far as any knowledge based upon reason or experience can go the relation of cause and effect is simply one of succession, unpressed upon the mind; by a

the case where something is moved by a stone itself impelled by a stick which the hand moves

we must go on until we come to one thing in motion which first moves But for Descartes unlike Aquinas this method of proving God as the first cause of all observable effects has less elegance than the so called ontological argument in which the conception of God as a necessary being incapable of not existing immediately implies his existence

The argument from effect to cause is traditionally called *a posteriori* reasoning in contrast to *a priori* reasoning from cause to effect According to Aristotle and Aquinas the latter mode of reasoning can only demonstrate the nature of a thing not its existence Aquinas furthermore does not regard the ontological argument as a form of reasoning at all but rather as the assertion that God's existence is self evident to us which he denies

The various forms which these arguments take and the issue concerning their validity are more fully discussed in the chapters on BEING GOD, and NECESSITY AND CONTINGENCY But here it is worth noting that Kant questions whether the *a posteriori* method of proving God's existence really differs from the ontological argument It is according to him not only illusory and inadequate but also possesses the additional blemish of an *ignoratio elenchi*—professing to conduct us by a new road to the desired goal but bringing us back after a short circuit to the old path which we had deserted at its call Hence the causal proof does not in Kant's opinion succeed in avoiding the fallacies which he along with Maimonides and Aquinas finds in the ontological argument

**THE ANALYSIS OF CAUSATION** figures critically in the speculation of the theologians concerning creation providence and the government of the world

The dogma of creation, for example requires the conception of a unique type of cause Even if the world always existed—a supposition which as we have seen is contrary to Jewish and Christian faith but not to reason—the religious belief in a Creator would remain a belief in that unique cause without whose action to preserve its being at every moment the world would cease to be

On the assumption that God created the world in the beginning it is perhaps easy enough to see with Augustine how the creating and originating work which gave being to all natures differs from all other types of causation which cause motions or changes or even the generation of things rather than their very existence It may however be more difficult to understand the creative action of God in relation to a world already in existence

But a theologian like Aquinas explains that as long as a thing has being so long must God be present to it as the cause of its being—a doctrine which Berkeley later repeats by saying that this makes the divine conservation to be a continual creation Aquinas agrees that the conservation of things by God is not by a new action but by the continuation of that action whereby He gives being But in the conservation of things Aquinas thinks that God acts through natural or created causes whereas in their initiation being is the proper effect of God alone

The dogma of divine providence also requires a theory of the cooperation of the first cause with natural or secondary causes Dante in describing the direction which providence gives to the course of nature uses the image of a bow

Whatsoever this bow shoots falls disposed to its foreseen end even as a thing directed to its aim That God governs and cares for all things may be supposed to reduce nature to a puppet show in which every action takes place in obedience to the divine will alone Natural causes would thus cease to be causes or to have any genuine efficacy in the production of their own effects

Some theologians have tended toward the extreme position but Aquinas argues contrariwise that natural causes retain their efficacy as instrumental causes subordinate to God's will as the one principal cause Since God wills that effects be because of their causes he writes all effects that presuppose some other effect do not depend solely on the will of God and in another place he says whatsoever causes He assigns to certain effects He gives them the power to produce those effects so that the dignity of causality is imparted even to creatures

In addition to the role of divine causality

for the theologian, nothing is exempt from God's will. Since the realm of nature includes human nature must not human acts be caused as are all other natural events? Are some human acts free in the sense of being totally uncaused, or only in the sense of being caused differently from the motions of matter? Are causality and freedom opposed principles within the order of nature, appropriate to physical and psychological action, or do they constitute distinct realms—as for Kant, the realms of phenomena and noumena, the sensible and the supra-sensible or as for Hegel, the realms of nature and history?

The different answers which the great books

give to these questions have profound consequences for man's view of himself, the universe and his place in it. As the issue of necessity and chance is central in physics or the philosophy of nature, so the issue of determinism and freedom is central in psychology and ethics, in political theory and the philosophy of history, and above all in theology. It makes opponents of James and Freud, of Hegel and Marx, of Hume and Kant, of Spinoza and Descartes, of Lucretius and Marcus Aurelius. It raises one of the most perplexing of all theological questions for Augustine, Aquinas, Pascal and for the two great poets of God's will and man's freedom—Dante and Milton.

### OUTLINE OF TOPICS

1. The general theory of causation	164
1a. The kinds of causes: their distinction and enumeration	167
1b. The order of causes: the relation of cause and effect	167
2. Comparison of causes in animate and inanimate nature	166
3. Causality and freedom	167
4. The analysis of means and ends in the practical order	
5. Cause in relation to knowledge	168
5a. Cause as the object of our inquiries	
5b. Cause in philosophical and scientific method: the role of causes in definition, demonstration, experiment, hypothesis	169
5c. The nature and sources of our knowledge of causes	170
5d. The limits of our knowledge of causes	170
6. The existence and operation of final causes	171
The causality of God or the gods	
7a. Divine causality in the origin and existence of the world: creation and conservation	172
7b. Divine causality in the order of nature or change: the first cause in relation to all other causes	
7c. Divine causality in the government of the universe: providence and free will	173
7d. Divine causality in the supernatural order: grace, miracles	173
8. The operation of causes in the process of history	175
	176

customary transition. That one event leads to another becomes more and more probable—but never more than probable—as the sequence recurs more and more frequently in experience.

Hume's skepticism about causes and his re-interpretation of the meaning of cause gains wide acceptance in subsequent thought especially among natural scientists. William James for example considering the principle that nothing can happen without a cause declares that we have no definite idea of what we mean by cause or of what causality consists in. But the principle expresses a demand for some deeper sort of inward connection between phenomena than their merely habitual time sequence seems to be. The word 'cause' is in short an altar to an unknown god—an empty pedestal still marking the place for a hoped-for statue. Any really inward belonging together of the sequent terms he continues if discovered would be accepted as what the word 'cause' was meant to stand for.

Though Hume holds that we cannot penetrate beyond experience to the operation of real causes imbedded in the nature of things he does not deny the reality of causation as a principle of nature. On the contrary he denies that anything happens by chance or that any natural occurrence can be uncaused. It is universally allowed Hume says with approval that nothing exists without a cause of its existence and that chance when strictly examined is a mere negative word and means not any real power which has anywhere a being in nature. But though there is no such thing as chance in the world our ignorance of the real cause of any event has the same influence on the understanding and begets a like species of belief or opinion.

In other words Hume's position seems to be that man's ignorance of real causes and the mere probability of his opinions about customary sequences of cause and effect indicate human limitations not limits to causal determination in the order of nature itself. Adversaries of Hume coming before as well as after him in the tradition of the great books take issue with him on both points.

Against Hume's determinism which is no less complete than Spinoza's Aristotle for example, affirms the existence of chance or real

contingency in the happenings of nature. Against Hume's reduction of statements about causes to probable opinion Kant insists that in the metaphysics of nature such judgments can be made with absolute certainty. These related issues are discussed in the chapters on CHANCE, FATE and NECESSITY AND CONTINGENCY.

In the development of the natural sciences since Hume's day his translation of cause and effect into observed sequences or correlations reinforces the tendency which first appears with Galileo and Newton to describe rather than to explain natural phenomena. Yet to the extent that the findings of science bear fruit in technology man's control over nature seems to confirm Bacon's view of science rather than Hume's—at least to the extent that the application of scientific knowledge to the production of effects implies a knowledge of their causes.

**THE PRINCIPLE OF CAUSALITY**—that nothing happens without a cause or sufficient reason or as Spinoza puts it nothing exists from whose nature an effect does not follow—has been made the basis for denials of human freedom as well as of chance or contingency in the order of nature. The problem of man's free will is discussed in the chapters on FATE, LIBERTY and WILL but we can here observe how the problem is stated in terms of cause with respect to both divine providence and natural causation.

If God's will is the cause of everything which happens if nothing can happen contrary to His will or escape the foresight of His providence then how is man free from God's foreordination when he chooses between good and evil? If as the theologians say the very act of free choice is traced to God as to a cause in what sense can the act be called free? Is it not necessarily determined to conform to God's will and to His plan? But on the other hand if everything happening from the exercise of free choice must be subject to divine providence must not the evil that men do be attributed to God as cause?

The problem takes another form for the scientist who thinks only in terms of natural causes especially if he affirms a reign of causality in nature from which nothing is exempt—just as

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad*, BK II [26, 283] 12d, the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS.** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS.** One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e.g. *Iliad* BK II [26, 283] 12d.

**BIBLE REFERENCES.** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e.g. OLD TESTAMENT *Nehemiah* 7:45—(D) *II Esdras* 7:46.

**SYMBOLS.** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference. *passim* signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

## ADDITIONAL READINGS

Listed below are works not included in *Cat B* of the Western World but relevant to the  
 idea and topics with which this chapter deals. These works are divided into two groups

I Works by authors represented in this collection.

II Works by authors not represented in this collection.

For the date place and other facts concerning the publication of the works cited consult  
 the Bibliography of Additional Readings which follows the last chapter of *The Great Ideas*.

## Chapter 9 CHANCE

### INTRODUCTION

ONE sense in which we use the word chance does not exclude the operation of causes. The chance event in this sense is not uncased. But within this meaning of chance there is the question of how the chance event is caused.

On one view what happens by chance is distinguished from what happens by nature in terms of a difference in manner of causation—the difference between the contingent and the necessary. On another view the chance event does not differ causally from that which happens regularly or uniformly. The difference lies not in the pattern of causes, but in our knowledge of them. The chance event is unpredictable or less predictable because of our ignorance of its causes, not because of any real contingency in the order of nature.

There is still a third sense of chance in which it means that which happens totally without cause—the absolutely spontaneous or fortuitous.

These three meanings of chance at once indicate the basic issues in which the concept is involved. The third meaning is the most radical. It stands in opposition to the other two. Their position to one another can be considered after we examine the sense in which chance excludes every type of cause.

The doctrine of absolute fortuitousness is indeterminism in its most extreme form. The familiar phrase "a fortuitous concourse of atoms" indicates the classical statement of this doctrine and identifies it in the great books with the theory of atomism. It would be more precise to say "with Lucretius' version of that theory" because it is with regard to chance that he departs from the teachers of Democritus and Epicurus, and adds an hypothesis of his own.

The swerve of the atoms, according to Lucretius, accounts for the origin of the world, the motions of nature, and the free will of man. But nothing accounts for the swerve of the atoms. It is uncaused spontaneous, fortuitous.

When the atoms are being carried downwards straight through the void by their own weight they push a little from their path at times quite undetermined and at undetermined places, yet only just so much as you would call a change of trend. If they did not swerve all things would fall down through the deep void like drops of rain, nor could collision come to be nor blows be brought to pass among the atoms; thus nature would never have brought anything to being.

Since the atoms differ in shape size, and weight, it might be supposed that the heavier atoms, falling straight yet more rapidly, would overtake and hit the lighter atoms, thus bringing about their grouping or interlocking. But this supposition says Lucretius, is contrary to reason. It may hold for things falling through water or thin air, but through the empty void all things, even of unequal weight, move with an equal velocity through the unresisting void. Therefore heavier things will never be able to fall on the lighter from above nor of themselves bring about the blows sufficient to produce the varied motions by which nature carries things on. Whence, Lucretius concludes, the atoms must swerve a little.

Once the atoms have collided the way in which they are locked together in the patterns of composite things, and all the subsequent motions of these things, can be accounted for by reference to the natural properties of the atoms. The atomic sizes, shapes, and weights determine how they behave singly or in combination. But the swerve of the atoms is not so determined. It is completely spontaneous.

~~that the cause of the coincidence is unknown to us, but rather holds that no such cause exists to be known.~~

The conception of the chance event as an uncaused coincidence of causes is an ancient as well as a modern doctrine. In his *Physics* Aristotle distinguishes between what happens by nature and what happens by chance in terms of different types of causality. Chance he writes is reckoned among causes many things are said both to be and to come to be as a result of chance. But the fact that its effects cannot be identified with any of the things that come to pass by necessity and always, or for the most part at once distinguishes the causality of chance from that of nature.

The early physicists, Aristotle observes found no place for chance among the causes which they recognized. Others there are who, indeed believe that chance is a cause but that it is inscrutable to human intelligence as "an divine thing and full of mystery." But to Aristotle himself "it is clear that chance is an incidental cause and that the causes of what comes to pass by chance are infinite." For this reason, he explains, chance is supposed to belong to the class of the indefinite and to be inscrutable to man. Though he distinguishes between spontaneity and chance he says that both are cases of effects which though they might result from intelligence or nature have in fact been caused by something *incidentally*.

What happens by nature happens regularly or for the most part through causal necessity. This necessity results from the operation of essential causes causes in the very nature of the moving things. When the regularity fails, it is due to the intervention of some accidental cause. What happens by chance then or contingently is always due to an accidental (or better incidental) cause. As indicated in the chapter on Cause, an accidental as opposed to an essential cause is, in Aristotle's theory, one which does not by itself produce the given effect. It does so only through the conjunction of other causes. But since it does not determine these other causes to operate, the effect—contingent or chance that is, by the contingency of several incidental causes works contingently.

A world in which chance really exists is remarkably different from a world in which necessity prevails, in which every thing is determined by causes and there are no uncaused coincidences. William James vividly epitomizes their difference by calling the world of absolute necessity or determinism—the world of Spinoza or Hegel—a block universe in contrast to what he describes as a "concatenated universe." Voltaire before him in his *Philosophical Dictionary* had used the phrase the concatenation of events to express the meaning of chance.

The phrase evokes the right image the picture of a world in which many concurrent lines of causality exercising no influence upon one another may nevertheless concatenate or be joined together to produce a chance result. The block universe presents the contrasting picture of a world in which each motion or act determines and is determined by every other in the fixed structure of the whole.

Spinoza claims for example that in nature there is nothing contingent but all things are determined from the necessity of the divine nature to exist and act in a certain manner. Chance in other words, does not exist in nature. A thing is said to be contingent Spinoza writes only with reference to a deficiency in our knowledge. For if we do not know that the essence of a thing involves a contradiction or if we actually know that it involves no contradiction and nevertheless we can affirm nothing with certainty about its existence because the order of causes is concealed from us that thing can never appear to us either as necessary or impossible and therefore we call it either contingent or possible." Hence for Spinoza contingency or chance is illusory rather than real—a projection of the mind's ignorance or of its inadequate knowledge of causes.

The issue between real indeterminism and absolute determinism—further discussed in the chapters on FATE AND NECESSITY AND COINCIDENCE—inevitably raises theological questions. Just as the theologian must reconcile man's free will with God's predestination so must he if he accepts its reality also reconcile chance with divine Providence apart from which nothing can happen either necessarily or contingently.

For Augustine it would seem that divine

If each motion is always due to another and the new always springs from the old in a determined order and if the atoms do not by swerving break through the decrees of fate so that cause does not follow cause through infinite time whence asks Lucretius is it wrested from fate this will whereby we move forward where pleasure leads each one of us and swerve likewise in our motions neither at a fixed time nor at a fixed place but only when and where the mind itself has prompted us? The answer he gives is that there must be in the atoms another cause of motion besides blows and weights whence comes this power born in us since we see that nothing can come to be from nothing

BEING ABSOLUTELY fortuitous the swerve of the atoms is absolutely unintelligible. There is no answer to the question why they chance to swerve at undetermined times and places. This unintelligibility may not however make the fortuitous either unreal or impossible. It can be argued that chance may exist even though for our limited understanding it remains mysterious.

The same problem of intelligibility arises with respect to that meaning of chance wherein it is identified with coincidence or contingency. Here as in the case of the absolutely fortuitous chance belongs to reality or nature. Some things always come to pass in the same way and others for the most part writes Aristotle as an observer of nature but there is also a third class of events besides these two—events which all say are by chance. Things of this last kind he goes on to say are those which come to pass incidentally—or accidentally.

According to this theory a real or objective indeterminism exists. Chance or contingency is not just an expression of human uncertainty born of insufficient knowledge. Contingency however differs from the fortuitousness or spontaneity of the atom's swerve in that it is a product of causes not their total absence. Of the contingent event there is no definite cause in Aristotle's opinion but there is a chance cause *i.e.* an indefinite one.

In the chance happening two lines of action coincide and thereby produce a single result. This is our ordinary understanding of the way

accidents happen. The chance meeting of friends who run across each other in a rail station after a separation of many years coincidence—a coinciding of the two separate and independent lines of action which brought each of them to the same station the same time coming from different places going to different places and proceeding despite the influence of different causes or forces. That each is there can be explained the operation of causes. That both are together cannot be explained by the causes determining their independent paths.

So understood the chance event exemplified what Aquinas calls a clashing of two causes. And what makes it a matter of chance is the fact that the clashing of these two causes,asmuch as it is accidental has no cause. Precisely because it is accidental this clashing causes is not to be reduced to a further preceding cause from which it follows of necessity.

The illustration is not affected by considerations of free will. Whether men have free will or not whether free acts are caused or are not Kant suggests uncaused and spontaneous, if event we call a chance meeting remains accidental or more precisely a coincidence. Whatever the factors are which control the motion of each man they operate entirely within the single man's line of action. Prior to the meeting they do not influence the other man's conduct. If we could state the cause for the coincidence of the two lines of motion it would have to be some factor which influenced both lines. Then there such a cause and were it known to us we could not say that the meeting happened by chance. It would still be a coincidence in the merely physical sense of coming together but it would not be a coincidence causally.

That free will is irrelevant to this meaning of chance can be seen from the fact that the collision of particles which produces atomic fission is regarded as resulting from chance or coincidence in a manner no different from the accidental meeting of friends. Causes control the speeds and directions of the colliding particles, but no cause determines their collision or in other words there is no cause for the coincidence of two separate lines of causation. Contemporary physics affirms a real or objective indeterminism insofar as it does not merely say

Regardless of what the objective situation is, the assurance with which we pre-  
dict anything reflects the state of our knowl-  
edge about it.

The ancients who, for the most part regard  
chance as real and objective, treat probability as subjective. For them the different degrees of  
probability which men attach to their state-  
ments measure the inadequacy of their knowl-  
edge—and the consequent uncertainty of their  
opinions about matters which cannot be known  
but only guessed. Holding different theories  
of the distinction between knowledge and  
opinion, both Plato and Aristotle exclude the  
accidental and the contingent along with the  
particular from the objects of science. Since in  
their view certitude belongs to the essence of  
science—or of knowledge as contrasted with  
opinion—science for them deals not only with the  
universal but with the necessary.

In the *Republic* Socrates assigns opinion to  
the realm of becoming—the realm of changing  
and contingent particulars. Unlike Plato, Aris-  
tote does not restrict knowledge to the realm of  
eternal and immutable being but he does insist  
that physics, as a science of changing things,  
preserve the certitude of science by concerning  
itself only with the essential and the necessary.  
"That a science of the accidental is not even  
possible," he writes, "will be evident if we try  
to see what the accidental really is." It is a mat-  
ter of chance that cold weather occurs during the  
dog-days, for thus occurs neither always and  
of necessity nor for the most part though it  
might happen sometimes. The accidental, then,  
is what occurs, but not always nor of necessity  
nor for the most part now—it is obvious  
why there is no science of such a thing.

Though he disagrees with Aristotle and  
Aquinas about the reality of chance or con-  
tingency, Spinoza agrees with them that knowl-  
edge—at least adequate knowledge—has the  
necessary for its object. Of individual things,  
he says, we can have no adequate knowledge

and this is what is to be understood by us as  
their contingency. To be true to itself and to  
the nature of things, reason must perceive  
that's truly that is to say as they are in them-  
selves, that is to say not as contingent but as  
necessary."

The position of Aquinas is worth stating for

comparison. To the question whether our  
intellect can know contingent things he re-  
plies that the contingent considered as such,  
is known directly by sense and indirectly by  
the intellect while the universal and necessary  
principles of contingent things are known by  
the intellect. Hence, he goes on if we con-  
sider knowable things in their universal prin-  
ciples, then all science is of necessary things.  
But if we consider the things themselves, thus  
some sciences are of necessary things, some of  
contingent things.

Among the sciences of contingent things,  
Aquinas includes not only the sciences of na-  
ture but also the moral sciences, because the  
latter dealing with human action must reach  
down to contingent particulars. In the sphere  
of morals as of nature, certainty can be achieved  
only on the level of universal principles. De-  
liberation about particular acts to be done  
moves on the level of probable opinion. In con-  
trast to the moral scientist the man of action  
must weigh chances and make decisions with  
regard to future contingencies. It would be as  
foolish, Aristotle says, to expect the certitude  
of scientific demonstration from an orator or a  
judge as to accept probable reasoning from a  
mathematician.

It is not surprising that the modern theory of  
probability—or as it was later called by Boole,  
Venn and others, the logic of chance—  
should have its origin in the sphere of practical  
problems. Pascal's correspondence with Fermat  
illustrates the early mathematical speculations  
concerning formulae for predicting the out-  
come in games of pure chance. For Pascal the  
logic of chance also has moral implications. If  
we are willing to risk money at the gaming  
table on the basis of calculated probabilities,  
how much more willing should we be to act  
decisively in the face of life's uncertainties,  
even to risking life itself on the chance of eternal  
salvation.

When we act on an uncertainty we act  
reasonably. Pascal writes, for we ought to  
work for an uncertainty according to the doc-  
trine of chance. If the chance of there being  
an after life is equal to the chance of there  
being none—if the equiprobability reflects our  
equal ignorance of either alternative—then,

providence leaves no room for chance among natural things After noting that causes are sometimes divided into a fortuitous cause a natural cause and a voluntary cause he dismisses those causes which are called fortuitous by saying that they are not a mere name for the absence of causes but are only latent and we attribute them either to the will of the true God or to that of spirits of some kind or other

In certain places Aquinas seems to talk in much the same fashion—as though chance existed only for our limited intellects and not for God Nothing he declares hinders certain things from happening by luck or chance if compared to their proximate causes but not if compared to divine providence according to which nothing happens at random in the world as Augustine says The example he uses to illustrate his point is that of two servants who have been sent by their master to the same place the meeting of the two servants although to them it appears a chance circumstance has been fully foreseen by their master who has purposely sent them to meet at one place in such a way that one has no knowledge of the other In such a way also all things must of necessity come under God's ordering from which it follows that God directly causes the action of even accidental causes and their coincidence The chance event would then be necessitated by God It would be determined by His will however indeterminate it might appear to us

Yet in other places Aquinas writes that God wills some things to be done necessarily some contingently To some effects He has attached unfailing necessary causes from which the effects follow necessarily but to other defective and contingent causes from which effects arise contingently For some minds this may only deepen the mystery rather than solve it At least it leaves many questions unanswered

Does Aquinas mean that a coincidence of causes is not itself uncaused? Does he mean that God causes the concatenation of events and that a sufficient reason for every contingency exists in God's will? If so is chance an illusion a function of our ignorance of divine Providence? May chance be quite real on the level of

nature where no natural causes determine the coincidence while not real—at least not in the same sense—for God? Or does the statement that what divine providence plans to happen contingently happens contingently mean that chance remains a real feature of the universe even for God?

One thing is clear In one sense of the word, the Christian theologians completely deny chance If chance means something which God does not foresee something unplanned by His providence then according to their faith nothing happens by chance It is in this sense also that what happens by chance is opposed to what happens on purpose or has a final as well as an efficient cause As the chapter on CAUSE indicates those who deny final cause in nature sometimes use the word chance to signify not lack of cause nor even contingency but only the blindness of causality—working to no end

The controversy discussed in the chapter on WORLD—between those who see in the structure of the universe the grand design of a divine plan and those who attribute whatever order there is in nature to blind chance—further indicates the sense in which theologians like Augustine and Aquinas deny chance But if chance means no more than *contingency* then to affirm chance excludes not providence but fate at least that sense of fate according to which everything is blindly necessitated Here it is Spinoza's statement that in nature there is nothing contingent but all things are determined from the necessity of the divine nature which opposes the statement of Aquinas that the mode both of necessity and contingency falls under the foresight of God

THE THEORY OF chance has obvious bearings on the theory of knowledge especially with regard to the distinction between knowledge and opinion and between certainty and probability

On any view of chance—whether it is real or illusory—when men call a future event contingent they mean that they cannot predict it with certitude So far as human prediction goes it makes no difference whether the future event is necessarily determined and we lack adequate knowledge of its causes or the event has a genuine indeterminacy in the way it is caused or

medicine and astrology. When the proconsul tells him that, as compared with medicine, astrology is a false art, Augustine, at this time himself much given to the books of the horoscope-makers, asks how the fact that "many things were foretold truly by [astrology]" can be explained. The proconsul answered, very reasonably that it was due to the force of chance, "which is always to be allowed for in the order of things." Thus, Augustine says later "I saw it is obvious that such things as happened to be and truly from the casting of horoscopes were true not by skill but by chance and such things as were false were not due to want of skill in the art but merely that luck had fallen the other way."

Neither art itself, nor skill in its practice, can ever be perfect enough to remove chance entirely for the artist deals with particulars. Yet the measure of an art is the certainty which its rules have as directions for achieving the desired result and the skill of the artist is measured by the extent to which he succeeds by rule and judgment rather than by chance.

When Aristotle quotes Vaginon's remark that "art loves chance and chance loves art," he expands its sense to be that "chance and art are concerned with the same objects"—that which does not come to be by nature nor from necessity. Hence art sometimes fails, either from uncontrollable contingencies or from insufficient knowledge of causes. "All causes," says Hume, "are not conjoined to their usual effects with like uniformity. An artificer who handles only dead matter may be disappointed of his aim, as well as the politician, who directs the conduct of sensible and intelligent agents."

In the realm of human affairs—in morals, politics, and history—the factor of chance is usually discussed in terms of good and bad fortune. The word "fortune"—as may be seen in the root which it shares with "fortuitous"—has the same connotations as "chance." Aristotle treats fortune as the kind of chance that operates in the sphere of human action rather than as real chance. Fortune, he thinks, can be attributed properly only to intelligent beings capable of deliberate choice. The sense of the distinction between chance and fortune seems to be borne out in history by the fact

that fortune, unlike chance, receives personification in myth and legend. Fortune is a goddess or like the Fates whom she combats, a power with which even the gods must reckon.

The doctrine of chance or fortune occupies an important place in moral theory. Aristotle's classification of goods tends to identify external goods with goods of fortune—the goods which unlike knowledge and virtue we cannot obtain merely by the exercise of our will and faculties. Considerin<sup>g</sup>, the elements of happiness, Aquinas groups together wealth, honor, fame, and power as goods of the same sort because they are due to external causes and in most cases to fortune.

The goods of fortune, as well as its ills, consist in things beyond man's power to command and, in consequence, to deserve. Recognizing the unpredictable operation of fortune, Epictetus, the Stoic, argues that we must make the best of those things that are in our power and take the rest as nature gives it. "We have the power to deal rightly with our own impressions." Hence the Stoics advise us to control our reactions to things even though we cannot control the things themselves. Yet men will always ask, as Hamlet does, Whether 'tis nobler in the mind to suffer the slings and arrows of outrageous fortune, or to take arms against a sea of troubles, and by opposing end them?

The fact that the goods and ills of fortune are beyond our power to control raises the further question of man's responsibility regarding them. We can hardly be held responsible for everything that happens to us, but only for those things which are subject to our will. This traditional moral distinction between the good or evil which befalls us by fortune and that which we willfully obtain or accomplish parallels the legal distinction between accidental and intentional wrongdoing.

What is true of the individual life seems to apply to history—the life of states and the development of civilization generally. For the most part the historians—Herodotus and Thucydides, Plutarch, Tacitus, and Gibbon—find fortune a useful principle of interpretation. To Machiavelli history seems to be so full of accidents and contingencies—great changes in affairs beyond all human conjecture—that he tries to advise the prince how to make

Pascal argues we ought to wager in favor of immortality and act accordingly. There is here the infinity of an infinitely happy life to gain a chance to gain against a finite number of chances of loss and what you stake is finite.

Like Pascal Hume thinks that we must be content with probability as a basis for action.

The great subverter of Pyrrhonism or the excessive principles of skepticism he writes is action and employment and the occupations of common life. But unlike the ancients Hume also thinks we should be content with probabilities in the sphere of the natural sciences. Certitude is attainable only by the mathematician who deals with the relations between ideas. Since the natural sciences deal with matters of fact or real existence and since to know such things we must rely entirely upon our experience of cause and effect we cannot reach better than probable conclusions.

The 'scientist' according to Hume, weighs opposite experiments. He considers which side is supported by the greater number of experiments to that side he inclines with doubt and hesitation and when at last he fixes his judgment the evidence exceeds not what we properly call probability. All probability then supposes an opposition of experiments and observations. A hundred instances or experiments on one side and fifty on another afford a doubtful expectation of any event, though a hundred uniform experiments with only one that is contradictory reasonably beget a pretty strong degree of assurance.

Hume applies the logic of chance to weighing the evidence against and the testimony in favor of miracles as well as to contrary hypotheses in science. As much as Spinoza he denies the existence of chance or contingency in the order of nature. Chance is entirely subjective. It is identical with the probability of our opinions. In the throw of dice the mind he says considers the turning up of each particular side as alike probable and this is the very nature of chance to render all the particular events comprehended in it entirely equal. But there may also be a probability which arises from a superiority of chances on any side and according as this superiority increases and surpasses the opposite chances the probability receives a proportionate increase. The case

Hume asserts is the same with the probability of causes as with that of chance.

Since Hume's day the theory of probability has become an essential ingredient of empirical science. The development of thermodynamics in the 19th century would have been impossible without it. This is also true of the quantum mechanics and atomic physics of our own time. But like the doctrine of chance the theory of probability tends in one of two directions either toward the subjective view that probability is only a quality of our judgments, measuring the degree of our ignorance of the real causes which leave nothing in nature undetermined or toward the objective view that there is genuine indeterminism in nature and that mathematical calculations of probability estimate the real chance of an event occurring.

THE ELEMENT OF CHANCE also has a bearing on the general theory of art. The hypothesis of the melody which a kitten might compose by walking on the keyboard is obviously intended to contrast a product of chance with a work of art. The competent musician knows with certainty that he can do what the meandering kitten has only one chance in many millions of ever accomplishing.

In proportion as an art is developed and to the degree that its rules represent a mastery of the medium in which the artist works, chance is excluded from its productions. This point is strikingly exemplified in the history of medicine. If there had been no such thing as medicine Hippocrates suggests and if nothing had been investigated or found out in it all practitioners would have been equally unskilled and ignorant of it and everything concerning the sick would have been directed by chance. On the same principle Galen distinguishes the physician from the empiric who, without knowing the cause, pretends that he is able to rectify the failures of function. The empiric works by trial and error—the very opposite of art and science for trial and error can succeed only by chance. The physician learned and skilled in medicine works from a knowledge of causes and by rules of art which tend to eliminate chance.

Augustine reports a conversation with the proconsul concerning the relative merits of

medicine and astrology. When the proconsul tells him that as compared with medicine astrology is a false art Augustine at this time himself much given to the books of the horoscopasters, asks how the fact that "many things are foretold truly by [astrology]" can be explained. The proconsul answered, very reasonably, that it was due to the force of chance which is always to be allowed for in the order of things. Thus, Augustine says later I saw it as obvious that such things as happened to be said truly from the casting of horoscopes were not due by skill but by chance and such things as were false were not due to want of skill in the art but merely that luck had fallen the other way.

Neither art itself nor skill in its practice can ever be perfect enough to remove chance entirely for the artist deals with particulars. Yet the measure of an art is the certainty which its rules have as directions for achieving the desired result and the skill of the artist is measured by the extent to which he succeeds by rule and judgment rather than by chance.

When Aristotle quotes Agathon's remark that art loves chance and chance loves art" he explains its sense to be that chance and art are concerned with the same objects"—that which does not come to be by nature nor from necessity. Hence art sometimes fails, either from uncontrollable contingencies or from insufficient knowledge of causes. All causes, says Hume are not conjoined to their usual effects with like uniformity. An artificer who handles only dead matter may be disappointed of his aim, as well as the politician who directs the conduct of sensible and intelligent agents.

In the realm of human affairs—in morals, politics, and history—the factor of chance is usually discussed in terms of good and bad fortune. The word fortune—as may be seen in the root which it shares with fortuitous—has the same connotations as chance. Aristotle treats fortune as the kind of chance that operates in the sphere of human action rather than natural chance. Fortune he thinks can be attributed properly only to intelligent beings capable of deliberate choice. The sense of this distinction between chance and fortune seems to be borne out in history by the fact

that fortune and chance receive personification in myth and legend. Fortune is a goddess or like the Fates whom she combats, a power with which even the gods must reckon.

The doctrine of chance or fortune occupies an important place in moral theory. Aristotle's classification of goods tends to identify external goods with goods of fortune—the goods which unlike knowledge and virtue we cannot obtain merely by the exercise of our will and faculties. Considering the elements of happiness Aquinas groups together wealth, honor, fame and power as goods of the same sort because they are "due to external causes and in most cases to fortune."

The goods of fortune as well as its ills, consist in things beyond man's power to command and, in consequence, to deserve. Recognizing the unpredictable operation of fortune Epictetus, the Stoic, argues that "we must make the best of those things that are in our power and take the rest as nature gives it." We have "the power to deal rightly with our own impressions." Hence the Stoics advise us to control our reactions to things even though we cannot control the things themselves. Yet men will always act, as Hamlet does. Whether to nobly in the mind to suffer the slings and arrows of outrageous fortune, or to take arms against a sea of troubles, and by opposing, end them?

The fact that the goods and ills of fortune are beyond our power to control raises the further question of man's responsibility regarding them. We can hardly be held responsible for everything that happens to us, but only for those things which are subject to our will. This traditional moral distinction between the good or evil which befalls us by fortune and that which we willfully obtain or accomplish parallels the legal distinction between accidental and intent and wrongdoing.

What is true of the individual life seems to apply to history—the life of states and the development of civilization generally. For the most part the historians—Herodotus and Thucydides, Plutarch, Tacitus, and Gibbon—find fortune a useful principle of interpretation. To Machiavelli history seems to be so full of accidents and contingencies—great changes in affairs beyond all human conjecture—"that he tries to advise the prince how to make

Pascal argues we ought to wager in favor of immortality and act accordingly. There is here the infinity of an infinitely happy life to gain a chance to gain against a finite number of chances of loss and what you stake is finite.

Like Pascal Hume thinks that we must be content with probability as a basis for action.

The great subverter of Pythagoreanism or the excessive principles of skepticism he writes is action and employment and the occupations of common life. But unlike the ancients Hume also thinks we should be content with probabilities in the sphere of the natural sciences. Certitude is attainable only by the mathematician who deals with the relations between ideas. Since the natural sciences deal with matters of fact or real existence and since to know such things we must rely entirely upon our experience of cause and effect we cannot reach better than probable conclusions.

The scientist according to Hume, weighs opposite experiments. He considers which side is supported by the greater number of experiments to that side he inclines with doubt and hesitation and when at last he fixes his judgment the evidence exceeds not what we properly call probability. All probability then supposes an opposition of experiments and observations. A hundred instances or experiments on one side and fifty on another afford a doubtful expectation of any event, though a hundred uniform experiments with only one that is contradictory reasonably beget a pretty strong degree of assurance.

Hume applies the logic of chance to weighing the evidence against and the testimony in favor of miracles as well as to contrary hypotheses in science. As much as Spinoza he denies the existence of chance or contingency in the order of nature. Chance is entirely subjective. It is identical with the probability of our opinions. In the throw of dice the mind he says considers the turning up of each particular side as alike probable and this is the very nature of chance to render all the particular events comprehended in it entirely equal. But there may also be a probability which arises from a superiority of chances on any side and according as this superiority increases and surpasses the opposite chances the probability receives a proportionate increase. The case

Hume asserts is the same with the probability of causes as with that of chance.

Since Hume's day, the theory of probability has become an essential ingredient of empirical science. The development of thermodynamics in the 19th century would have been impossible without it. This is also true of the quantum mechanics and atomic physics of our own time. But like the doctrine of chance, the theory of probability tends in one of two directions either toward the subjective view that probability is only a quality of our judgments, measuring the degree of our ignorance of the real causes which leave nothing in nature undetermined or toward the objective view that there is genuine indeterminism in nature and that mathematical calculations of probability estimate the real chance of an event's occurring.

THE ELEMENT OF CHANCE also has a bearing on the general theory of art. The hypothesis of the melody which a kitten might compose by walking on the keyboard is obviously intended to contrast a product of chance with a work of art. The competent musician knows with certainty that he can do what the meandering kitten has only one chance in many millions of ever accomplishing.

In proportion as an art is developed and to the degree that its rules represent a mastery of the medium in which the artist works chance is excluded from its productions. This point is strikingly exemplified in the history of medicine. If there had been no such thing as medicine Hippocrates suggests and if nothing had been investigated or found out in it all practitioners would have been equally unskilled and ignorant of it and everything concerning the sick would have been directed by chance. On the same principle Galen distinguishes the physician from the empiric who, without knowing the cause, pretends that he is able to rectify the failures of function. The empiric works by trial and error—the very opposite of art and science for trial and error can succeed only by chance. The physician learned and skilled in medicine works from a knowledge of causes and by rules of art which tend to eliminate chance.

Augustine reports a conversation with the proconsul concerning the relative merits of

measure and astrology. When the proconsul tells him that, as compared with medicine or law it is a like art, Augustine at this time uses of "what given to the books of the horoscope-casters," sees how the fact that "many things were foretold truly by [astrology]" can be explained. The proconsul "answered, very reluctantly" that it was due to the force of chance which is always to be allowed for in the order of things." Thus, Augustine says later "I saw it is obvious that such things as happened to be said truly from the casting of horoscopes were not by skill but by chance—and such things as were not due to want of skill in the art but merely that luck had failed the other way."

Whether art itself, nor skill in its practice, can ever be perfect enough to remove chance entirely for the artist deals with particulars. Yet the measure of an art is the certainty which it must have as directions for achieving the desired result, and the skill of the artist is measured by the extent to which he succeeds by rule and judgement rather than by chance.

When Hume quotes Aristotle's remark that "Art loves chance and chance loves Art" he explains his sense to be that "chance and art are concerned with the same objects"—that which does not come to be by nature nor from necessity. Hence art sometimes fails, either from unavoidable contingencies or from insufficient knowledge of causes. "All causes," says Hume, "are not composed to their usual effects with like uniformity. An artificer who busies only dead matter may be disappointed of his aim, as well as the politician, who directs the conduct of sensible and intelligent agents."

In the realm of human affairs—in morals, politics, and history—the factor of chance is usually discussed in terms of good and bad fortune. The word "fortune"—as may be seen in the root which it shares with "fortuitous"—has the same connotations as "chance." Aristotle treats fortune as the kind of chance that operates in the sphere of human action rather than natural chance. Fortune, he thinks, can be attributed properly only to intelligent beings capable of deliberate choice. The sense of the distinction between chance and fortune seems to be borne out in history by the fact

that fortune unlike chance, receives personalization in myth and legend. Fortune is a goddess or like the Fates when the combat, a power with which even the gods must reckon.

The doctrine of chance or fortune occupies an important place in moral theory. Aristotle's classification of goods tends to identify external goods with goods of fortune—the goods which, unlike knowledge and virtue, we cannot obtain merely by the exercise of our will and faculties. Consider, for example, the elements of happiness. Aquinas groups together wealth, honor, fame and power as goods of the same sort because they are "due to external causes and in most cases to fortune."

The goods of fortune, as well as its like, consist in things beyond man's power to command and, as consequence, to deserve. Regarding the unpredictable operation of fortune, Epicurus, the Stoic, argues that "we must make the best of those things that are in our power and take the rest as nature gives it." We have "the power to deal rightly with our own impressions." Hence the Stoic said we must control our reactions to them even though we cannot control the things themselves. Let men will always as, as Hamlet does, "Whether 'tis nobler in the mind to suffer the slings and arrows of our notorious fortune, or to take arms against a sea of troubles and by opposing end them?"

The fact that the goods and ill of fortune are beyond our power to control raises the further question of man's responsibility regarding them. We can hardly be held responsible for everything that happens to us, but only for those things which are subject to our will. This traditional moral distinction between the good or evil which befalls us by fortune and that which we willfully obtain or accomplish parallels the legal distinction between accidental and intentional wrongdoing.

What is true of the individual life seems to apply to his army—the life of states and the development of a nation generally. For the most part the historians—Herodotus and Thucydides, Plutarch, Tacitus, and Gibbon—find fortune a useful principle of interpretation. To Machiavelli history seems to be so full of accidents and contingencies—"great changes in affairs—beyond all human conjecture"—that he tries to advise the prince how to make

use of fortune in order to avoid being ruined by it. Such advice can be followed because in his opinion Fortune is the arbiter of one half of our actions but still leaves us to direct the other half or perhaps a little less.

Hegel on the contrary does not admit chance or fortune in his view of world history as a necessary development out of the concept of the mind's freedom alone. For Tolstoy also either necessity or freedom rules the affairs of men. Chance he writes does not denote any really existing thing but only a certain stage of understanding of phenomena. Once we succeed in calculating the composition of forces involved in the mass movements of men we

shall not be obliged to have recourse to chance for an explanation of those small events which made these people what they were but it will be clear that all those small events were inevitable.

As the contingent is opposed to the necessary as that which happens by chance is opposed to that which is fully determined by causes so fortune is opposed to fate or destiny. This opposition is most evident in the great poems especially the tragedies which depict man's efforts to direct his own destiny now pitting his freedom against both fate and fortune now courting fortune in his struggle against fate.

### OUTLINE OF TOPICS

TOPIC	PAGE
1 The conception of chance	187
1a Chance as the coincidence of causes	
1b Chance as the absolutely fortuitous—the spontaneous or uncaused	
2 The issue concerning the existence of chance or fortune	188
2a The relation of chance to causality—philosophical or scientific determinism	
2b The relation of chance to fate—providence and predestination	
3 Chance, necessity and design or purpose in the origin and structure of the world	189
4 Cause and chance in relation to knowledge and opinion—the theory of probability	
5 The control of chance or contingency by art	
6 Chance and fortune in human affairs—the mythology of Fortune	190
6a Chance and fortune in the life of the individual	
6b Chance and fortune in politics and history	191

## CHAPTER 9 CHANCE

## REFERENCES

To find the passage cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example in 411 *MEP* / ad sec II [265-283] 12d, the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 12.

**PAGES CITED** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example in 531 *PS* Psychology 116a 119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 *PLATO Symposion* 163b-164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**ARTHAS** One or more of the main divisions of a work (such as PARTS, etc.) are sometimes included in the reference line numbers, in brackets, are given in parentheses, e.g. *Iliad BK. II [65-83] 12d*.

**BIBLIOGRAPHIES** The references are to book, chapter and verse. When the King James and Douay versions differ in the books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by (D) follows, e.g. *Old Testament* *Leviticus 7:45-(D) II Kings 4:6*

**SMOKES** The above usage esp. call the reader's attention to one or more especially distinct parts of a whole, if the expression *passim* signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For detailed information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

## *Chapter 10* CHANGE

### INTRODUCTION

FROM the pre-Socratic physicists and the ancient philosophers to Darwin, Marx and James—and in our own day Dewey and Whitehead—the fact of change has been a major focus of speculative and scientific inquiry.

Except by Parmenides and his school the existence of change has never been denied. Nor can it be shown by rejecting all sense-perception as illusory which is precisely what Zeno's paradoxes seem to do, according to one interpretation of them. But if argument cannot refute the testimony of the senses, neither can reason bring support to it. The fact of change, because it is evident to the senses, does not need proof.

That change is, is evident but what change is, is neither evident nor easy to define. What principles or factors are common to every sort of change, how change or becoming is related to permanence or being, what sort of existence belongs to mutable things and to change itself—these are questions to which answers are not obtainable merely by observation. Nor will simple observation without the aid of experiment, measurement and mathematical calculation discover the laws and properties of motion.

The analysis of change or motion has been a problem for the philosophers of nature. They have been concerned with the definition of change, its relation to being, the classification of the kinds of change. The measurement of motion on the other hand and the mathematical formulation of its laws have occupied the experimental natural scientist. Both natural philosophy and natural science share a common subject matter though they approach it by different methods and with different interests. Both are entitled to use the name physics for the subject matter.

The Greek word *physis* from which physics comes has, as its Latin equivalent, the word

natura from which nature comes. In their original significance both words had reference to the sensible world of changing things, or to its underlying principle—to the ultimate source of change. The physics of the philosopher and the physics of the empirical scientist are alike inquiries concerning the nature of things, not in every respect but in regard to their change and motion. The conclusions of both inquiries have metaphysical implications for the nature of the physical world and for the character of physical existence.

The philosopher draws these implications for being from the study of becoming. The scientist in turn, draws upon philosophical distinctions in order to define the objects of his study. Galileo, for example, in separating the problem of freely falling bodies from the motion of projectiles, employs the traditional philosophical distinction between natural and violent motion. The analysis of time and space (basic variables in Newtonian mechanics) the distinction between discontinuous and continuous change and the problem of the divisibility of a continuous motion—these are philosophical considerations pre-supposed by the scientific measurement of motion.

WE HAVE SO FAR used the words change and motion as well as becoming as if all three were interchangeable in meaning. That is somewhat inaccurate even for the ancients who regarded all kinds of change except one as motions; it is much less accurate for the moderns who have tended to restrict the meaning of motion to local motion or change of place. It is necessary therefore to examine briefly the kinds of change and to indicate the problems which arise with these distinctions.

In his *physical treatises*, Aristotle distinguishes four kinds of change. When the change

## THE GREAT IDEAS

from contrary to contrary is *in quantity*, he writes it is growth and diminution when it is *in place* it is motion, when it is *in quality* it is alteration but when nothing persists of which the resultant is a property (or an accident in any sense of the term) it is coming to be and the converse change is passing away Aristotle also uses other pairs of words — generation and corruption becoming and perishing — to name the last kind of change

Of the four kinds of change only the last is not called 'motion'. But in the context of saying that becoming cannot be a motion Aristotle also remarks that every motion is a kind of change. He does not restrict the meaning of motion to change in place which is usually called local motion or locomotion. There are then according to Aristotle's vocabulary three kinds of motion (1) local motion in which bodies change from place to place (2) alteration or qualitative motion in which bodies change with respect to such attributes as color texture or temperature (3) increase and decrease or quantitative motion in which bodies change in size. And in addition there is the one kind of change which is not motion — generation and corruption. This consists in the coming to be or passing away of a body which while it has being exists as an individual substance of a certain sort.

Becoming and perishing are most readily exemplified by the birth and death of living things but Aristotle also includes the transformation of water into ice or vapor as examples of generation and corruption. One distinctive characteristic of generation and corruption in Aristotle's conception of this type of change is their instantaneity. He thinks that the other three kinds of change are continuous processes taking time whereas things come into being or pass away instantaneously. Aristotle thus applies the word motion only to the continuous changes which time can measure. He never says that time is the measure of change but only of motion.

But the contrast between the one mode of change which is not motion and the three kinds of motion involves more than this difference with regard to time and continuity. Aristotle's analysis considers the subject of change — that

which undergoes transformation — and starting point and goal of motion. Every motion he says proceeds from something to something, that which is directly in motion being distinct from that to which it is in motion and that from which it is in motion for instance — we may take the three things wood hot and cold of which the first is that which is in motion the second is that which to which the motion proceeds and the third is that from which it proceeds.

In the alteration which occurs when the wood changes quality just as in the increase or decrease which occurs with a body's change in quantity and in the local motion which occurs with a body's change of place that which changes persists throughout the change as the same kind of substance. The wood does not cease to be wood when it becomes hot or cold the stone does not cease to be a stone when it rolls from here to there or the organism an animal of a certain kind when it grows in size. In all these cases the substratum — that which is the subject of change — persists and changes in its own properties. The body although persisting as the same body is now healthy and now ill and the bronze is now spherical and at another time angular and yet remains the same bronze.

Because the substance of the changing thing remains the same while changing in its properties — i.e. in such attributes or accidents as quality quantity and place — Aristotle groups the three kinds of motion together as *accidental change*. The changing thing does not come to be or pass away absolutely but only in a certain respect. In contrast generation and corruption involve a change in the very substance of a thing. When nothing perceptible persists in its identity as a substratum and the thing changes as a whole then according to Aristotle it is a coming to be of one substance, and the passing away of another.

In such becoming or perishing it is matter itself rather than a body or a substance which is transformed. Matter takes on or loses the form of a certain kind of substance. For example when the nutriment is assimilated to the form of a living body the bread or corn becomes the flesh and blood of a man. When an animal dies its body decomposes into the etc.

nents of inorganic matter. Because it is a change of substance itself, Aristotle calls the one kind of change which is not motion *substantial change* and speaks of it as a coming-to-be or passing-away simply—that is, not in a certain respect but absolutely or without qualification.

These distinctions are involved in a long tradition of discussion and controversy. They cannot be affirmed or denied without opposite sides being taken on the fundamental issues concerning substance and accident, matter and form, and the causes of change or motion. The adoption or rejection of these distinctions affects one's view of the difference between inorganic and organic change, and the difference between the motions of matter and the changes which take place in mind. The statement of certain problems is determined accordingly as, for example, the problem of the transmutation of the elements, which persists in various forms from the physics of the ancients through mediaeval alchemy and the beginnings of modern chemistry to present considerations of radioactivity and atomic fission.

*Sicut in the 17TH CENTURY motion has been identified with local motion I can conceive no other kind of motion. Descartes writes, and do not consider that we ought to conceive any other in nature. As it is expressed "in common parlance motion he says, is nothing more than the act in by which any body passes from one place to another.*

This can hardly be taken to mean that change of place is the only observable type of change. That other kinds of change are observable cannot be denied. The science of mechanics or dynamics may be primarily or exclusively concerned with local motions, but other branches of natural science certainly—chemistry deals with qualitative transformations and the biological sciences study growth and decay, birth and death.

The emphasis on local motion as the only kind of motion while it does not exclude apparent changes of other sorts, does raise a question about their reality. The question can be put in several ways. Are the various apparently different kinds of change really distinct, or can they all be reduced to aspects of one underlying

mode of change which is local motion? Even supposing that the kinds of change are not reducible to one another is local motion primary in the sense that it is involved in all the others?

When mechanics dominates the physical sciences (as has been so largely the case in modern times) there is a tendency to reduce all the observable diversity of change to various appearances of local motion. Newton, for example, explicitly expresses this desire to formulate all natural phenomena in terms of the mechanics of moving particles. In the Preface to the first edition of his *Mathematical Principles* after recounting his success in dealing with celestial phenomena he says, I wish we could derive the rest of the phenomena of nature by the same kind of reasoning from mechanical principles, for I am induced by many reasons to suspect that they may all depend upon certain forces by which the particles of bodies by some causes hitherto unknown are either mutually impelled towards one another and cohere in regular figures, or are repelled and recede from one another.

The notion that all change can be reduced to the results of local motion is not however of modern origin. Lucretius expounds the theory of the Greek atomists that all the phenomena of change can be explained by reference to the local motion of indivisible particles coming together and separating. Change of place is the only change which occurs on the level of the ultimate physical reality. The atoms neither come to be nor pass away nor change in quality or size.

But though we find the notion in ancient atomism, it is only in modern physics that the emphasis upon local motion tends to exclude all other kinds of change. It is characteristic of what James calls the modern mechanico-physical philosophy to begin by saying that the only facts are collocations and motions of primordial solids, and the only laws the changes of motion which changes in collocation bring. James quotes Helmholtz to the effect that the ultimate goal of theoretic physics is to find the last unchanging causes of the processes of Nature. If to this end "we imagine the world composed of elements with unalterable qualities," then Helmholtz continues, the only

changes that can remain in such a world are spatial changes, i.e., movements and the only outer relations which can modify the action of the forces are spatial too or in other words the forces are motor forces dependent for their effect on spatial relations.

In the history of physics Aristotle represents the opposite view. No one of the four kinds of change which he distinguishes has for him greater physical reality than the others. Just as quality cannot be reduced to quantity or either of these to place so in his judgment the motions associated with these terms are irreducible to one another. Yet Aristotle does assign to local motion a certain primacy. Motion in its most general and primary sense he writes is change of place which we call locomotion. He does not mean merely that this is the primary sense of the word but rather that no other kind of motion can occur without local motion being somehow involved in the process. Showing how increase and decrease depends on alteration and how that in turn depends on change of place he says that of the three kinds of motion it is this last which we call locomotion that must be primary.

THE SHIFT IN MEANING of the word motion would not by itself mark a radical departure in the theory of change but it is accompanied by a shift in thought which has the most radical consequences. At the same time that motion is identified with local motion Descartes conceives motion as something completely actual and thoroughly intelligible. For the ancients becoming of any sort had both less reality and less intelligibility than being.

Aristotle had defined motion as the actuality of that which is potential in a respect in which it is still potential to some degree. According to what Descartes calls its strict as opposed to its popular meaning motion is the transference of one part of matter or one body from the vicinity of those bodies that are in immediate contact with it and which we regard as in repose, into the vicinity of others. Thus definition—contrasted with the Aristotelian conception which it generally supersedes in the subsequent tradition of natural science—is as revolutionary as the Cartesian analytical geometry is by comparison with the Euclidean. Nor

is it an unconnected fact that the analysis geometry prepares the way for the differential calculus that is needed to measure variations their velocities and their acceleration.

The central point on which the two definitions are opposed constitutes one of the fundamental issues in the philosophy of nature. Does motion involve a transition from potential to actual existence or only the substitution of one actual state for another—only a transportation as Descartes says from one place to another?

While motion is going on the moving thing according to Aristotle's definition must be partly potential and partly actual in the same respect. The leaf turning red while it is alien has not yet fully reddened. When it becomes as red as it can get it can no longer change in that respect. Before it began to change it was actually green and since it could become red it was potentially red. But while the change is in process the potentiality of the leaf to become red is being actualized. This actualization progresses until the change is completed.

The same analysis would apply to a ball in motion. Until it comes to rest in a given place, its potentiality for being there is undergoing progressive actualization. In short motion involves some departure from pure potentiality in a given respect and never complete attainment of full actuality in that same respect. When there is no departure from potentiality motion has not yet begun when the attainment of actuality is complete the motion has terminated.

The Aristotelian definition of motion is the object of much ridicule in the 17th century. Repeating the phrasing which had become traditional in the schools—the actualization of what exists in potentiality, in so far as it is potential—Descartes asks: Now who understands these words? And who at the same time does not know what motion is? Will not even one admit that those philosophers have been trying to find a knot in a bulrush? Locke also finds it meaningless. What more exquisite jargon could the wit of man invent than this definition which would puzzle any rational man to whom it was not already known by its famous absurdity to guess what word it could ever be supposed to be the explication of if

: fully asking a Dutchman what *beuegung* e  
as, Locke continues should have received  
his explication in his own language that it  
was *actus entis in potentia quaenam in potentia*  
ask whether any one can imagine he could  
thereby have guessed what the word *beuegung*  
meant?

Locke does not seem to be satisfied with any  
definition of motion. The atomists, who define  
motion to be a passage from one place to an  
other, what do they more than put one synonymous  
word for another? For "hat is passus  
than *motus*?" Nor will the successive  
application of the superficies of one body to  
those of another which the Cartesians give us  
prove a much better definition of motion when  
well examined. But though Locke rejects the  
definition of the atomists and the Cartesians  
on formal grounds, he accepts their idea of  
motion as simply change of place; whereas he  
dismisses the Aristotelian definition as sheer  
absurdity and rejects the idea that motion or  
change necessarily involves a potentiality capa-  
ble of progress or fulfillment.

As we have already remarked, the omission  
of potentiality from the conception of motion  
is a theoretical shift of the deepest significance.  
It occurs not only in Descartes *Principles of  
Philosophy* and in the atomism of Hobbes and  
Gassendi, but also in the mechanics of Galileo  
and Newton. According to these modern philos-  
ophers and scientists, a moving body is always  
actually somewhere. It occupies a different  
place at every moment in a continuous motion.

The motion can be described as the successive  
occupation by the body of different places at  
different times. Though all the parts of the motion  
do not coexist the moving particle is com-  
pletely actual throughout. It loses no reality  
and gains none in the course of the motion  
since the various positions the body occupies  
lie totally outside its material nature. It would,  
of course, be more difficult to analyze alteration  
in color or bulk, or growth in these terms but  
it must be remembered that efforts have been  
made to apply such an analysis through the re-  
duction of all other modes of change to local

The principle of inertia first discerned by  
Galileo, is critically relevant to the issue be-  
tween these two concepts of motion. It is

stated by Newton as the first of his axioms or  
laws of motion. Every body he writes  
continues in its state of rest or of uniform  
motion in a right line unless it is compelled to  
change that state by forces impressed upon it.  
As applied to the motion of projectiles, the  
law declares that they continue in their mo-  
tions, so far as they are not retarded by the re-  
sistance of air or impelled down wards by the  
force of gravity.

In his experimental reasoning concerning the  
acceleration of bodies moving down inclined planes, Galileo argues that a body which has  
achieved a certain velocity on the descent  
would if it then proceeded along a horizontal plane continue infinitely at the same velocity  
—except for the retardation of air resistance  
and friction. Any velocity once imparted to a  
moving body he maintains, will be rigidly  
maintained as long as the external causes of ac-  
celeration or retardation are removed. So in  
the case of projectiles, they would retain the  
velocity and direction imparted to them by the  
cannon were it not for the factors of gravity  
and air resistance. Bodies actually in motion  
possess their motion in themselves as a complete  
actuality. They need no causes acting on them  
to keep them in motion but only to change  
their direction or bring them to rest.

The motion of projectiles presents a difficulty  
for the theory which describes all motion as a  
reduction of potency to act. If everything that  
is in motion, with the exception of things that  
move themselves, is moved by something else  
how is it Aristotle asks, that some things,  
e.g. things thrown continue to be in motion  
when their mover is no longer in contact with them?  
This is a problem for Aristotle precisely  
because he supposes that the moving cause  
must act on the thing being moved throughout  
the period of the motion. For the potentiality  
to be progressively reduced to actuality it  
must be continuously acted upon.

Aristotle's answer postulates a series of causes  
so that contact can be maintained between the  
projectile and the moving cause. The original  
mover he writes gives the power of being  
a mover either to a *terram* or to water or to some-  
thing else of the kind naturally adapted for  
imparting and undergoing motion. The motion  
begins to cease when the motive force pro-

duced in one member of the consecutive series is at each stage less than that possessed by the preceding member and it finally ceases when one member no longer causes the next member to be a mover but only causes it to be in motion. It follows that inertia must be denied by those who hold that a moving body *always* requires a mover or even that a body cannot sustain itself in motion beyond a point proportionate to the quantity of the impressed force which originally set it in motion.

FOR THE ANCIENTS the basic contrast between being and becoming (or between the permanent and the changing) is a contrast between the intelligible and the sensible. This is most sharply expressed in Plato's distinction between the sensible realm of material things and the intelligible realm of ideas. What is that which always is and has no becoming? Timaeus asks and what is that which is always becoming and never is? He answers his own question by saying that that which is apprehended by intelligence and reason is always in the same state but that which is conceived by opinion with the help of sensations and without reason is always in a process of becoming and perishing and never really is.

Even though Aristotle differs from Plato in thinking that change and the changing can be objects of scientific knowledge he too holds becoming to be less intelligible than being precisely because change necessarily involves potentiality. Yet becoming can be understood to the extent that we can discover the principles of its being—the unchanging principles of change. In pursuing the truth Aristotle remarks—and this applies to the truth about change as well as everything else—one must start from the things that are always in the same state and suffer no change.

For Aristotle change is intelligible through the three elements of permanence which are its principles (1) the enduring substratum of change and the contraries—(2) that to which and (3) that from which the change takes place. The same principles are sometimes stated to be (1) matter (2) form and (3) privation—the matter or substratum being that which both lacks a certain form and has a definite potentiality for possessing it. Change occurs when

the matter undergoes a transformation in which it comes to have the form of which it was deprived by the possession of a contrary form.

Neither of the contrary forms changes. Only the thing composite of matter and form changes with respect to the forms of its matter. Hence these principles of change are themselves unchanging. Change takes place through not in them. As constituents of the changing thing they are the principles of its mutable being; principles of its *being* as well as of its being *mutable*.

The explanation of change by reference to what does not change seems to be common to all theories of becoming. Lucretius, as we have already seen, explains the coming to be and passing away of all other things by the motions of atoms which neither come to be nor pass away. The eternity of the atoms underlies the mutability of everything else.

Yet the atoms are not completely immutable. They move forever through the void which, according to Lucretius is required for their motion. Their local motion is moreover an actual property of the atoms. For them to be is to be in motion. Here then as in the Cartesian theory no potentiality is involved and motion is completely real and completely intelligible.

THE NOTIONS OF TIME AND ETERNITY are inseparable from the theory of change or motion. As the chapters on TIME and SPACE indicate local motion involves the dimensions of space as well as time but all change requires time and time itself is inconceivable apart from change or motion. Furthermore as appears in the chapters on TIME and ETERNITY the two fundamentally opposed meanings of eternity differ according to whether they imply endless change or absolute changelessness.

Eternity is sometimes identified with infinite time. It is in this sense that Plato in the *Timaeus* refers to time as the moving image of eternity and implies that time which belongs to the realm of ever changing things resembles the eternal only through its perpetual endurance. The other sense of the eternal is also implied—the sense in which eternity belongs to the realm of immutable being. The eternal in this sense as Montaigne points out is not merely that which never had beginning nor never

will be *c* endin<sup>g</sup>, but rather that to which we can bring no mutation.

There are two great problems which use the word "eternity" in these opposite senses. One is the problem of the eternity of motion—the question whether motion has or can have either beginning or an end. The other is the problem of the existence of eternal objects—immutable things which have their being apart from time and change.

The two problems are connected in ancient thought. Aristotle, for example, argues that it is impossible that movement should either have come into being or cease to be, for it must always have existed.<sup>1</sup> Since nothing is moved at random, but there must always be something present to move it, a cause is required to sustain the endless motions of nature. This cause, which Aristotle calls "the prime mover," must be something which moves without being moved, being eternal, substance, and actuality.<sup>2</sup>

Aristotle's theory of a prime mover sets up a hierarchy of causes to account for the different kinds of motion observable in the universe. The perfect circular motion of the heavens serves to mediate between the prime mover which is totally unmoved and the less regular cycles of terrestrial change. The "constant cycle" of movement in the stars differs from the irregular cycle of generation and destruction on earth. For the first Aristotle asserts the necessity of something which is always moved with an unceasing motion, which is motion in a circle. He calls this motion of the first heavenly sphere "the simple spatial movement of the universe" as a whole. Besides this there are other spatial movements—those of the planets—which are eternal but are always acting in different ways and so are able to account for the other cycle in nature—the irregular cycle of generation and corruption.

In addition, a kind of changelessness is attributed to all the celestial bodies which Aristotle calls "eternal." Eternally in motion, they are also eternally in being. Though not immovable, they are supposed to be incorruptible substances. They never begin to be and never perish.

The theory of a world eternally in motion is challenged by Jewish and Christian theologians

who affirm, as an article of their religious faith, that "in the beginning God created heaven and earth." The world's motions, like its existence have a beginning in the act of creation. Creation itself, however, is not change or motion of any sort, except according to our way of understanding. For change means that the same thing should be different now from what it was previously. But in creation by which the whole substance of a thing is produced the same thing can be taken as different now and before, only according to our way of understanding so that a thing is understood as first not existing at all, and afterwards as existing. Since creation is an absolute coming to be from non-being no pre-existent matter is acted upon as in generation in artistic production, or in any of the forms of motion.

THE PHILOSOPHICAL and theological issues concerning creation and change, eternity and time are further discussed in the chapters on *CASE*, *ETERNITY* and *WORLD*. Other problems arising from the analysis of change must at least be briefly mentioned here.

Though less radical than the difference between creation and change, the difference between the motions of inert or non-living things and the vital activities of plants and animals raises for any theory of change the question whether the same principles apply to both. The rolling stone and the running animal both move locally but are both motions *locomotion* in the same sense? Augmentation occurs both in the growth of a crystal and the growth of a plant but are both of them growing in the same sense? In addition, there seems to be one kind of change in living things which has no parallel in the movements of inert bodies. Animals and men learn. They acquire knowledge from habits and change them. Can change of mind be explained in the same terms as change in matter?

The issues raised by questions of this sort are more fully discussed in the chapters on *ANIMAL*, *HABIT* and *LIFE*. Certain other issues must be entirely reserved for discussion elsewhere. The special problems of local motion—such as the properties of rectilinear and circular motion, the distinction between uniform and variable motion and the uniform or variable accelera-

tion of the latter—are problems which belong to the chapters on ASTRONOMY and MECHANICS Change furthermore is a basic fact not only for the natural scientist but for the historian—the natural historian or the historian of man and society The considerations relevant to this aspect of change receive treatment in the chapters on EVOLUTION History, and PROGRESS

Even these ramifications of discussion do not exhaust the significance of change The cyclical course of the emotions and the alternation of pleasure and pain have been thought inexplicable without reference to change of state in regard to desire and aversion—the motion from want to satisfaction or from possession to deprivation Change is not only a factor in the analysis of emotion but it is also itself an object of man's emotional attitudes It is both loved and hated sought and avoided

According to Pascal man tries desperately to avoid a state of rest He does every thing he can to keep things in flux Our nature consists in motion he writes complete rest is death Nothing is so insufferable to man he continues as to be completely at rest without pas

sions without business without diversion without study He then feels his nothingness his forlornness his dependence his weakness his emptiness Darwin does not think that the desire for change is peculiar to man The lower animals, he writes are likewise capricious in their affections aversions and sense of beauty There is also reason to suspect that they like novelty for its own sake

But men also wish to avoid change The old Prince Bolkonski in *War and Peace* could not comprehend how any one could wish to all the life or introduce anything new into it This is not merely an old man's view For the most part it is permanence rather than transience the enduring rather than the novel which the poets celebrate when they express man's content with his own mutability The withering and perishing of all mortal things the assault of time and change upon all things familiar and loved have moved them to elegy over the evanescent and the ephemeral Frost Virgil's *Sunt lacrimae rerum et mentem mortalia tangunt* to Shakespeare's Love is not lost which alters when it alteration finds the poets have mourned the inevitability of change

## OUTLINE OF TOPICS

1 The nature and reality of change or motion	201
2 The unchanging principles of change	203
2a The constituents of the changing thing	203
2b The factor of opposites or contraries in change	21
3 Cause and effect in motion the relation of mover and moved or action and passion	21
4 Motion and rest contrary motions	25
5 The measure of motion	
5a Time or duration as the measure of motion	25
5b The divisibility and continuity of motion	25
6 The kinds of change	
6a The reducibility of all modes of motion to one kind of change	26
6b The primacy of local motion	26
6c Comparison of change in living and non living things	26
6d Comparison of the motions of matter with changes in the order of mind	26

1. The analysis of local motion	
2. Space, place, and void	
3. Natural and violent motion	
4. Kinds of local motion	208
(i) Rectilinear and rotary or circular motion	
(ii) Uniform or variable motion	
(iii) Absolute or relative motion	
(iv) Terrestrial and celestial motion	
5. The properties of animal motion: the laws of motion	
6. Change of size	209
6a. The increase and decrease of inanimate bodies	
6b. Growth in living organisms	
7. Change of quality	
7a. Physical and chemical change: compounds and mixtures	210
7b. Biological change: vital alterations	
8. Substantial change: generation and corruption	
8a. Substantial change in the realm of bodies: the transmutation of the elements	211
8b. Plant, animal, and human reproduction	
8c. The incorruptibility of atoms, the heavenly bodies, and spiritual substances	
9. The apprehension of change: by sense, by reason	212
10. Emotional aspects of change	
10a. Rest and motion in relation to pleasure and pain	
10b. The love and hatred of change	
11. The problem of the eternity of motion or change	213
12. The theory of the prime mover: the order and hierarchy of movers and moved	214
13. The immutable	
13a. The immutability of the objects of thought: the realm of truth	
13b. The unalterability of the decrees of fate	
13c. The unchangeability of God	215

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad* BK II [265 283] 12d, the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page; the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS** One or more of the main divisions of a work (such as PART BK. CH. SECT.) are sometimes included in the reference line numbers in brackets are given in certain cases e.g. *Iliad* BK II [265 283] 12d

**BIBLE REFERENCES** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e.g. OLD TESTAMENT *Nehemiah* 7:45-(D) II *Ezra* 7:46

**SYMBOLS** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference. Passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

# Chapter II CITIZEN

## INTRODUCTION

CITIZEN like comrade has been and still is a revolutionary word. Both words have been titles proudly adopted by men to mark their liberation from the yoke of despotism or tyranny. Both titles are still sought by those who have not yet gained admission to the fraternity of the free and equal.

The rank and status of citizenship first appeared in the ancient world with the beginning of constitutional government in the city states of Greece. The Greeks were conscious of this fact and proud of it. In terms of it they set themselves apart from the barbarians who were subjects of the Great King of Persia or the Egyptian Pharaoh. The Spartan heralds according to Herodotus thus address the Persian commander: Thou hast experience of half the matter but the other half is beyond thy knowledge. A slave's life thou understandest but never having tasted liberty thou canst not tell whether it is sweet or no. Ah! hadst thou known what freedom is thou wouldest have bidden us fight for it not with the spear only but with the battle axe.

Not only Herodotus and Thucydides but also the great tragic poets notably Aeschylus in the *Persians* record this Hellenic sense of distinction from the surrounding peoples who still lived in childlike submission to absolute rule. But the Greeks were also conscious that their political maturity as self governing citizens was as Aristotle intimates in the *Politics* a recent development from the primitive condition in which tribal chieftains ruled despotically.

The basic distinction between *subjection* and *citizenship* is inseparable from the equally basic distinction between absolute and limited or between despotic and constitutional government. The difference between these two modes of government is treated in the chapter on

CONSTITUTION. It is sufficient here to note that the difference in the authority and powers possessed by rulers—according as it is absolute or limited—corresponds with a difference in the status the degree of freedom and the rights and privileges of the people ruled.

IN ORDER TO UNDERSTAND citizenship it is necessary to understand the several ways in which men can belong to or be parts of a political community. There are two divisions among men within a community which help us to define citizenship.

According to one of these divisions, the native born are separated from aliens or foreigners. In the Greek city states it was almost impossible for aliens to become citizens. Plutarch notes that Solon's law of naturalization which he qualifies as of doubtful character would not allow strangers to become citizens unless

they were in perpetual exile from their own country or came with their whole family to trade there. The metics or aliens who were allowed in the city were usually a class apart.

In Rome the situation was different. It was possible for outsiders to receive the high honor of Roman citizenship. The aspiring genius of Rome Gibbon writes sacrificed vanity to ambition and deemed it more prudent as well as honourable to adopt virtue and merit for her own wheresoever they were found among slaves or strangers enemies or barbarians.

Most modern republics set up naturalization proceedings for the regular admission of some if not all immigrants to membership in the state. Yet a difference always remains between a citizen and a denizen or mere resident. Accordingly Rousseau criticizes Bodin for confusing citizens with townsmen. M. D'Alembert he says has avoided this error and is

his article on Geneva has clearly distinguished the four orders of men (or even five counting mere fortyners) who dwell in our town of which two only compose the Republic.

According to a second way in which men are divided within the political community free men are separated from slaves. The latter though they may be native-born, are not members of the political community but merely part of its property. A slave according to Aristotle is one who being a human being is also a possession. But he says in another place, property even though living beings are included in it is no part of a state for a state is not a community of living beings only but a community of equals.

On this principle Aristotle excludes more than the chattel slave from the status and privilege of citizenship. We cannot consider all those to be citizens, he writes, who are necessary to the existence of the state for example children are not citizens equally with grown-up men. In ancient times and among some nations, he continues, the artisan class were slaves or serfs and therefore the majority of them are so now. The best form of state will not admit them to citizenship.

The slaves who minister to the wants of individuals, and the mechanics or laborers who are the servants of the community are to be counted as its "necessary people" but not as members of the state. When he discusses the size and character of the population for an ideal state Aristotle says, we ought not to include everybody for there must always be in cities a multitude of slaves and sojourners and foreigners but we should include only those who are members of the state and who form an essential part of it.

The exclusion of slaves and resident aliens from membership in the political community has a profound bearing on the meaning of the political concept expressed by the words the people. The people is not the same as the *populus* — all those human beings who live within the state's borders. Even in societies which have abolished chattel slavery and in which servitude tends to be unrestricted infants and aliens remain outside the pale of political life. The people is always a part—the active political part—of the population.

THE DISTINCTION OF CITIZEN FROM SLAVE AND ALIEN DOES NOT COMPLETE THE PICTURE. The subjects of a king are not slaves nor are they citizens of a republic. Yet like citizens subjects have membership in the political community. They constitute the people the king serves as well as rules unless he is a tyrant for only if he is a tyrant does he treat them as if they were his property to be used for his own pleasure or interest. Sometimes a distinction is made between first and second class citizens and then the latter who occupy an intermediate position between citizens and slavery are regarded as subjects. Since there are many forms of government Aristotle writes, there must be many varieties of citizens, and especially of citizens who are subjects so that under some governments the mechanic and the laborer will be citizens, but not in others. The whole meaning of citizenship changes for Aristotle when the working classes are admitted to it.

From a somewhat different point of view Aquinas holds that a man can be said to be a citizen in two ways, first absolutely, secondly in a restricted sense. A man is a citizen absolutely if he has all the rights of citizenship, for instance the right of debating or voting in the popular assembly. On the other hand any man may be called citizen only in a restricted sense if he dwells within the state even lowly people or children or old men who are not fit to enjoy power in matters pertaining to the common welfare. Those who are thus disfranchised but are not slaves are subjects rather than citizens in the full sense.

It is possible of course for men to have the dual status of subject and citizen as is the case now in England and the self-governing dominions of the British Commonwealth. This double status does not blur the distinction between citizen and subject rather it signifies the mixed nature of a form of government which is both royal—at least in its vestiges of monarchy—and constitutional. In the time of Locke when a great constitutional victory had been won against the despotism of the last Stuart the English people did not yet regard themselves as citizens. Observing that the title of citizen has never been given to the subjects of any prince not even the ancient Macedonians Rousseau finds himself compelled to add, not

even the English of today though they are nearer liberty than anyone else

Unlike citizens the subjects of a king especially of one claiming absolute power have no voice in their own government and no legal means for protecting their natural rights as men So long as the absolute ruler does not tyrannize he governs for the welfare of his people and so though a despot in the sense of wielding absolute power over political inferiors he is benevolent in the sense of serving rather than using them But if he ceases to be benevolent and turns tyrannical his subjects have no recourse except rebellion They must resort to violence in order to emancipate themselves from a condition which amounts to slavery

A citizen on the other hand is safeguarded in his legal as well as in his natural rights and in some modern republics at least he is provided with judicial means for rectifying supposed injustices For citizens the right of rebellion is the last not the only resort

**THE DISTINCT CONDITIONS** of slavery subjection and citizenship can be summarized by defining three ways in which rulers are related to the persons they rule These three relations seem to have been first clearly differentiated by Aristotle

He finds all three relationships in the structure of the household is that is constituted in antiquity Of household management he writes there are three parts—one is the rule of a master over slaves another of a father and a third of a husband In each case the kind of rule differs the freeman rules over the slave after another manner from that in which the male rules over the female or the man over the child

As we have already seen Aristotle conceives the slave as a piece of property When he says that the slave wholly belongs to his master or that he is a part of his master a living but separated part of his bodily frame he is obviously considering only the chattel slave There are as the chapter on SLAVERY indicates other kinds or degrees of slavery less extreme than this

But chattel slavery more clearly than the attenuated forms of servitude defines the nature of mastery The master manages or uses

the slave as he manages and uses other instruments—inanimate tools or domesticated animals The rule of a master Aristotle declares is exercised primarily with a view to the interest of the master Yet it accidentally considers the slave since if the slave perishes the rule of the master perishes with him

Thus conceived the slave lacks every vestige of political liberty He is treated as radically inferior to his master—almost as if he were something less than a man He has no voice in his own government nor is his welfare the paramount consideration of his ruler In short we have slavery when one man governs another in the way in which a man manages his property using it for his own good

When one man governs another in the way in which good parents administer the affairs of children as members of the household we have the type of rule which also appears in the relation between absolute kings or benevolent despots and their subjects The rule of a father over his children is royal Aristotle writes for he rules by virtue of both love and of the respect due to age exercising a kind of royal power A king Aristotle adds is the natural superior of his subjects but he should be of the same kin or kind with them and such is the relation of elder and younger father and son

From the analogous type of rule in the family we see two differences between the condition of a slave and that of a subject under absolute or despotic rule in the state The infamy of children unlike that of slaves is not their permanent condition It is an aspect of their immaturity They are temporarily incapable of judging what is for their good and so need the direction of their superiors in age experience and prudence But children have some equality with their parents, to the extent that their humanity is recognized as the reason why they should not be ruled as slaves but governed for their own welfare

The government of children Aristotle declares is exercised in the first instance for the good of the governed or for the common good of both parties but essentially for the good of the governed In the same way the subjects of a benevolent despot or of any absolute monarch who rules paternalistically are said to be

overned for their own good They are served or used by their rulers and to this extent they have a degree of political liberty But they do not have the complete liberty which exists only in self government

That occurs only under constitutional rule which for Aristotle has an imperfect analogue in the family in the relation of husband and wife In the state however it is perfectly represented by the relation between the holders of public office and other citizens In the constitutional state Aristotle says "the citizens rule and are ruled by turns for the idea of a constitutional state implies that the natures of the citizens are equal and do not differ at all The citizen in other words is one who has the power to take part in the deliberative or judicial administration of the state Rousseau seems to have a similar conception of the citizen as both ruling and ruled though he uses the word subject to designate the citizen as ruled "The people he writes are called citizens as sharing in the sovereign power and subjects as being under the laws of the State

Because the man who holds office in a constitutional government is first of all a citizen himself, and only secondly an official vested with the authority of a political office the citizen is a man ruled by his equals and ruled as an equal Observing these facts Aristotle describes citizenship as the one *and* *finis* office set up by a constitution It is indefinite both in tenure and by comparison with the various magistracies or other offices which have more definitely assigned functions Since a citizen is ruled only by other citizens, and since he has the opportunity of ruling others in turn citizenship involves political liberty in the fullest sense This does not mean freedom from government but freedom through self-government—all the freedom a man can have in society liberty under law and proportioned to justice.

Two of these three political conditions—slavery and subjection—naturally receive fuller treatment in the chapter on Slavery The discussion of the third citizenship belongs not only to this chapter but also to the chapter on Constitution and to other chapters which deal with forms of constitutional government such as ARISTOCRACY DESOCRACY and OLLIGARCHY

FOR THE SAME REASON that the revolutionists against absolutism or despotism in the 18th century use the phrase free government for the republican institutions they also use citizen to designate a free man a man who possesses the political liberty and equality which they regard as the natural right of men because they are men In this respect they do not differ substantially from their Greek or Roman ancestors who prize constitutional government and citizenship as conditions of freedom and equality

Furthermore like the constitutionalists of antiquity the republicans of the 18th century are with few if any exceptions, not democrats in the sense of extending the rights and privileges of citizenship to all adults In the 18th century slavery still exists and a large part even of those who are not in economic bondage remains outside the pale of citizenship disqualified by accidents of birth such as race or sex and by the lack of sufficient wealth or property which makes it necessary for them to labor in order to live It is not only an ancient oligarchy like Aristotle who thinks that the ruling class should be the owners of property for they are citizens, and the citizens of a state should be in good circumstances whereas mechanics should have no share in the state In the 18th century as well as in ancient Greece extending the privileges of citizenship to indentured apprentices, day laborers or journeymen is a form of racism known as extreme democracy

Kant may be taken as representative of an enlightened point of view in the 18th century He finds that there are three juridical attributes that belong by right to the citizens 1 constitutional freedom as the right of every citizen to have to obey no other law than that to which he has given his consent or approval 2 civil equality as the right of the citizen to recognize no one as a superior among the people in relation to himself and 3 political independence as the right to assert his existence and continuance in society not to the arbitrary will of another but to his own in his and *pro* *versa* member of the commonwealth

The last attribute leads Kant to distinguish between active and passive citizenship Although he admits that this appears to stand in contradiction to the definition of a citizen as

such he concludes that there are some in the community not entitled to the full privileges of citizenship. It is his contention widely shared in the 18th century that suffrage which properly constitutes the political qualification of a citizen presupposes the independence or self sufficiency of the individual citizen among the people.

Consequently he denies suffrage to every one who is compelled to maintain himself not according to his own industry but as it is arranged by others. Such a restriction he says includes the apprentice of a merchant or tradesman a servant who is not in the employ of the state a minor and all women. They are passive parts of the state and do not have the right to deal with the state as active members of it to reorganize it or to take action by way of introducing certain laws. Kant insists however that it must be made possible for them to raise themselves from this passive condition in the State to the condition of active citizenship.

THE FOREGOING DISCUSSION shows the connection between the idea of citizenship and the two revolutionary movements which John Stuart Mill notes in the history of political thought and action. The first is the movement to obtain recognition of certain immunities called political liberties or rights which it was to be regarded as a breach of duty in the ruler to infringe and which if he did infringe specific resistance or general rebellion was held to be justifiable. This is the revolutionary effort to overthrow despotism and to establish constitutional government with the status of citizenship for at least some part of the population—frequently much less than half of the total.

The second revolutionary movement goes further. It presupposes the existence of government by law and aims to perfect it. It therefore seeks to obtain the establishment of constitutional checks by which the consent of the community or of a body of some sort supposed to represent its interests is made a necessary condition to some of the more important acts of the governing power. Since according to Mill it aims to make the consent of the governed effective through an adequate representation of their wishes this movement inevitably leads to

the fight against franchise restrictions and for universal suffrage which would admit even normal adult human beings to the freedom and equality of citizenship.

The first revolution has a long history. It begins with the Greek city states which, having won this victory against the Persians lost it to the Macedonian conquerors. It happens again with the establishment of the Roman republic after the expulsion of the Tarquins, and a time is undone when the Caesars assume absolute power. This part of the story is told with varying emotions by Plutarch and Polybius, Tacitus and Gibbon. During the Middle Ages the struggle appears in the various efforts to establish the supremacy of law particularly through the development of customary and canon law. The revolution still continues in the 17th and 18th centuries and the new beliefs it reaches are reflected in the writings of a constitutionalist like Locke and republicans like Rousseau, Kant and the American Federalists. The Declaration of Independence and the Constitution of the United States are perhaps the classic documents of this historical phase.

The second revolution particularly as identified with the fight for universal suffrage is a relatively recent event. Its roots may go back as far as Cromwell's time to the activity of the Levellers and in the 18th century to the writings of John Cartwright. But what is, perhaps, its first full expression does not appear until Mill's *Representative Government*. In that book Mill lays down the principles of the franchise reforms which began in the 19th century but which as in the case of woman suffrage or the repeal of the poll tax were carried through only yesterday or are still in progress.

Yet the struggle for universal suffrage—or as Mill would say against treating any human being as a political pariah—does have an ancient parallel in the conflict between democratic and oligarchical constitutions in Greek political life and thought. These two types of constitution were opposed on the qualifications for citizenship and public office. The oligarchical constitution restricted both to men of considerable wealth. At the other extreme as Aristotle observes the most radical forms of Greek democracy granted citizenship to the working classes and gave no advantage to the rich in

filling the magistracies for they selected officials from the whole citizenry by lot.

The parallelism goes no further than that. Greek democracy even when it denied special privileges to the propertied classes never contemplated the abolition of slavery or the political emancipation of women.

HERE ARE OTHER differences between ancient and modern institutions which affect the character of citizenship. The problem of who shall be admitted to citizenship is fundamental in both epochs. Insofar as it connotes the condition of political liberty and equality the status of citizenship remains essentially the same. But the rights and duties the privileges and immunities which belong to citizenship vary with the difference between ancient and modern constitutionalism.

*Even if they had been written* the constitutions of the ancient world would not have declared the rights of man and the citizen nor would they have had bills of rights appended to them. The significance of these modern innovations (which began perhaps with Magna Carta) lies not in a new conception of citizenship but in the invention of judicial means to endow the primary office of citizenship with sufficient legal power to protect it from invasion by government.

In *The Federalist* Hamilton maintains that bills of rights are in their origin stipulations between kings and their subjects abridgments of prerogative in favour of privilege reservations of rights not surrendered to the prince. Defending the absence of a special bill of rights in the original Constitution he insists that the Constitution is itself in every rational sense and to every useful purpose a bill of rights. It declares and specifies the political privileges of the citizens in the structure and administration of the government and defines certain immunities and modes of proceeding which are relative to personal and private concerns.

Nevertheless, the right of free speech and free assembly and the right to trial by a jury of peers along with the immunity from unwarranted searches and seizures or from *ex post facto* laws and bills of attainder provided by the early amendments to the Constitution do

give the citizen additional protection against interference in the performance of his civic duties such as independent political thought and action or in the exercise of his human privileges such as freedom of religious worship. The invention of these constitutional devices sprang from the bitter experience of coercion and intimidation under Star Chamber proceedings royal censorship and unlimited police power. A citizen who can be coerced or intimidated by his government differs only in name from the subject of an absolute despot.

In addition to having these legal safeguards modern differs from ancient citizenship in the way in which its rights and privileges are exercised. The machinery of suffrage is not the same when citizens act through elected representatives and when they participate directly in the deliberations and decisions of government by voting in the public forum.

THE PROBLEM OF EDUCATION for citizenship is in some respects stated in almost identical terms by such different political philosophers as Plato and John Stuart Mill.

In both the *Republic* and the *Laws* Plato emphasizes that education is the constraining and directing of youth towards that right reason which the law affirms. By this he means not only that education will affect the laws but also that the laws themselves have an educational task to perform. The educational program is thus planned and conducted by the state. The guardians—the only citizens in the *Republic* in the full sense of the term—are trained for public life first by the discipline of their passions and second by the cultivation of their minds. Their passions are disciplined by music and gymnastics their minds cultivated by the liberal arts and dialectic.

In the democracy which Mill contemplates as an ideal the most important point of excellence is to promote the virtue and intelligence of the people themselves. He does not outline a specific curriculum for the training of citizens but it is clear that he thinks their education cannot be accomplished in the schools alone. The superiority of democracy according to Mill lies in the fact that it calls upon the citizen to weigh interests not his own to be guided in case of conflicting claims by another

rule than his private partialities to apply at every turn principles and maxims which have for their reason of existence the common good and he usually finds associated with him in the same work minds more familiarized than his own with these ideas and operations whose study it will be to supply reasons to his understanding and stimulation to his feeling for the general interest In this school of public spirit a man becomes a citizen by doing the work of a citizen and so learning to act like one

If the future citizen is to act like a free man must he not also be trained in youth to think like one? Vocational training prepares a man to be an artisan not a citizen Only liberal education is adequate to the task of creating the free and critical intelligence required for citizenship Hence in a state which rests on universal suffrage the educational problem becomes greatly enlarged in scope if not in intrinsic difficulty

With the advent of universal suffrage which Mill advocates the state must face the responsibility for making liberal education available to every future citizen To say that all normal children have enough intelligence to become citizens but to regard the native endowment of a large number of them as incapable of liberal education makes a travesty of citizenship Will the child who cannot profit by liberal education be able to discharge the duties of the office to which he will be admitted upon coming of age?

**THE TRAINING OF CHARACTER** is always more difficult than the training of mind In education for citizenship the problem of moral training involves the question—discussed in the chapter on VIRTUE—whether the good man and the good citizen are identical in virtue

For Aristotle and seemingly also for Mill the virtue of the good man under an ideal constitution would be identical with that of the good citizen As both ruling and being ruled the good citizen ought to be capable of both Aristotle writes He should know how to govern like a freeman and how to obey like a free man—these are the virtues of a citizen And although the temperance and justice of a ruler are distinct from those of a subject the virtue of a good man will include both for the virtue

of the good man who is free and also a subject e.g. his justice will not be one but will comprise distinct kinds the one qualifying him to rule the other to obey

The virtues of the citizen direct him primarily in the performance of his obligations to the state But if the welfare of the state is not the ultimate end of man if there are higher goods which command human loyalty if man's common humanity takes precedence over his membership in a particular state then civic virtue does not exhaust human excellence More may be morally required of the good man than of the good citizen The virtues of the saint and the patriot may be of a different order

On this question the great books reveal a fundamental disagreement among moralists and political philosophers who differ as Plato and Hegel differ from Augustine and Aquinas or from Locke and Mill on the place of the state in human life

The ancients frequently appeal to a law higher than that of the state Socrates forever stands as the classic example of one who would rather die than disobey his inner voice—the command of his conscience A Stoic like Marcus Aurelius is willing to give unqualified allegiance to the political community only when it is the ideal city of man embracing the whole human brotherhood My city and my country so far as I am Antoninus he says is Rome but so far as I am a man —whose nature is rational and social — it is the world

For Christian theologists membership in the city of God is a higher vocation than citizenship in any earthly community—even when that is the city of man at its best The city of God demands a higher order of virtue than the city of man Referring to the earthly city Augustine says that the things which this city desires cannot justly be said to be evil for it is itself in its own kind better than all other human goods For it desires earthly peace for the sake of enjoying earthly goods It is all right for men to seek these things for they are good things and without doubt the gifts of God But Augustine goes on to say if they neglect the better things of the heavenly city which are secured by eternal victory and peace never-ending and so inordinately covet these present good things that they believe them to be the

only desirable things," then in Au stine's opinion they are misdirected in their love.

In giving precedence to the commandments of God the theologians do not deprecate the commands of the state or the obligations of manhood. But those who belong to both cities may find themselves faced with a conflict between the law of the state and the divine law. In such circumstances, the faithful have no choice. They must obey God before man. "Laws that are contrary to the commandments of God" Aquinas holds "do not bind a man in conscience and 'should not be obeyed.'

**THE CONFLICT BETWEEN** human and divine law finds expression in antiquity in the *Antigone* of Sophocles. It was not Zeus who had published me that edict. Ant one says of the human law she disobeys, nor deemed I that the decrees were of such force that a mortal could override the unwritten and unshaking statutes of heaven. For this life is not of to-day or yesterday but from all time and no man knows when they were first put forth.

The problem in which Antigone faces can occur in as many other ways as there are possibilities of tension between individual conscience or de-

sire and political obligation. Whatever form this takes the conflict confronts the political philosopher with all the questions that constitute the problem of the individual and society or man and the state.

To what extent and in what respects is the individual's personality sacred and inviolable by the state? How much freedom from government has the individual a right to demand? How much individual sacrifice has the state a right to expect? Is the state merely a means in the individual's pursuit of happiness or the end to which all other goods must be ordered? Is man made for the state or the state for man?

To questions of this sort the answers range from philosophical anarchism at one extreme to equally philosophical totalitarianism at the other with all degrees of individualism and communism in between. The general problem of man and the state with all its controversial issues runs through many other chapters—such as *CONSTITUTION, GOOD AND EVIL, LAW, LIBERTY, and STATE*—but we have placed its principal formulation in this chapter because the concept of citizenship grasps the ideal condition of the human individual as a member of the political community.

## OUTLINE OF TOPICS

1 The individual in relation to the state	6
2 The conception of citizenship	27
2a The status or office of citizenship in relation to the principle of constitutional government	27
2b The distinction between citizen and subject; the distinction between the subjects of a constitutional monarchy and of a despotism	28
2c The character and extent of citizenship under different types of constitutions	28
3 The qualification of citizenship; extent of suffrage	
4 The rights, duties, privileges and immunities of citizenship	
5 The virtues of the citizen and the virtues of the good man	
6 Education for citizenship	9
7 Political citizenship and membership in the city of God	230
8 The idea of world citizenship; the political brotherhood of man	
9 Historical episodes and stages in the struggle for citizenship	231

rule than his private partialities to apply at every turn principles and maxims which have for their reason of existence the common good and he usually finds associated with him in the same work minds more familiarized than his own with these ideas and operations whose study it will be to supply reasons to his understanding and stimulation to his feeling for the general interest. In this school of public spirit a man becomes a citizen by doing the work of a citizen and so learning to act like one.

If the future citizen is to act like a free man must he not also be trained in youth to think like one? Vocational training prepares a man to be an artisan not a citizen. Only liberal education is adequate to the task of creating the free and critical intelligence required for citizenship. Hence in a state which rests on universal suffrage the educational problem becomes greatly enlarged in scope if not in intrinsic difficulty.

With the advent of universal suffrage which Mill advocates the state must face the responsibility for making liberal education available to every future citizen. To say that all normal children have enough intelligence to become citizens but to regard the native endowment of a large number of them as incapable of liberal education makes a travesty of citizenship. Will the child who cannot profit by liberal education be able to discharge the duties of the office to which he will be admitted upon coming of age?

**THE TRAINING OF CHARACTER** is always more difficult than the training of mind. In education for citizenship the problem of moral training involves the question—discussed in the chapter on VIRTUE—whether the good man and the good citizen are identical in virtue.

For Aristotle and seemingly also for Mill the virtue of the good man under an ideal constitution would be identical with that of the good citizen. As both ruling and being ruled the good citizen ought to be capable of both. Aristotle writes: He should know how to govern like a freeman and how to obey like a free man—these are the virtues of a citizen. And although the temperance and justice of a ruler are distinct from those of a subject the virtue of a good man will include both for the virtue

of the good man who is free and also a subject, e.g. his justice will not be one but will comprise distinct kinds the one qualifying him to rule the other to obey.

The virtues of the citizen direct him primarily in the performance of his obligations to the state. But if the welfare of the state is not the ultimate end of man if there are higher goods which command human loyalty if man's common humanity takes precedence over his membership in a particular state then one virtue does not exhaust human excellence. More may be morally required of the good man than of the good citizen. The virtues of the saint and the patriot may be of a different order.

On this question the great books reveal a fundamental disagreement among moralists and political philosophers who differ as Plato and Hegel differ from Augustine and Aquinas, or from Locke and Mill on the place of the state in human life.

The ancients frequently appeal to a law higher than that of the state. Socrates forever stands as the classic example of one who would rather die than disobey his inner voice—the command of his conscience. A Stoic like Marcus Aurelius is willing to give unqualified allegiance to the political community only when it is the ideal city of man embracing the whole human brotherhood. My city and my country so far as I am Antoninus he says is Rome but so far as I am a man—whose nature is rational and social—it is the world.

For Christian theologians membership in the city of God is a higher vocation than citizenship in any earthly community—even when that is the city of man at its best. The city of God demands a higher order of virtue than the city of man. Referring to the earthly city Augustine says that the things which this city desires cannot justly be said to be evil for it is itself in its own kind better than all other human goods. For it desires earthly peace for the sake of enjoying earthly goods. It is all in fit for men to seek these things for they are good things and without doubt the gifts of God. But Augustine goes on to say if they neglect the better things of the heavenly city which are secured by eternal victory and peace never ending and so inordinately covet these present good things that they believe them to be the

XIV SECT I 18c

## REFERENCES

To find the passages cited, use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOEVER *Iliad* BK II [26, 283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS.** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology*, 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page; the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS.** One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference line numbers in brackets are given in certain cases, e.g. *Iliad* BK II [65-83] 12d.

**BIBLE REFERENCES.** The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows, e.g. OLD TESTAMENT *Nehemiah* 7:45-(D) *II Esdras* 7:46.

**SYMBOLS.** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference; *passim* signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas*; consult the Preface.

## *Chapter 12. CONSTITUTION*

### *INTRODUCTION*

THE idea of a constitution as establishing and organizing a political community—the principle of constitutionality as determining a generic form of government having many varieties and the nature of constitutional government—these three problems are so intimately connected that they must be treated together. We have used the word "constitution" to express the root notion from which all other matters considered in this chapter are derived.

It is impossible to say precisely what a constitution is in a way that will fit the political reality of the Greek city states, the Roman republic and its transformation into the empire, mediaeval kingdoms and communes and their gradual metamorphosis into the limited monarchies and republics of modern times. No definition can adequately comprehend all the variations of meaning to be found in the great works of political theory and history. But there are a number of related points in the various meanings of "constitution" which indicate what is common to the understanding of such diverse thinkers as Plato and Locke, Aristotle and Rousseau, Kant and Mill, Montesquieu and Hegel, Aquinas, Hobbes and the American Federalists.

IT HAS BEEN SAID that the constitution is the *soul* of the state. This can be interpreted to mean that the political as opposed to the domestic community requires a constitution in order to exist just as a work of art has the very principle of its being in the form which the artist imposes upon matter. In the context of his general theory of political association Aristotle seems to think that the man who first founded the state was the greatest of benefactors, may imply that the idea of a constitution is the creative principle by which the state was or g-

inally formed—or at least differentiated from the tribe and family.

Kant gives explicit expression to the notion that the invention of constitutions is coeval with the formation of states. "The act by which a People is represented as constituting itself in to a State," he writes, "is termed the Original Contract, and this in turn signifies the rightfulness of the process of organizing the Constitu-

In this sense the constitution appears to be identical with the organization of a state. It would then seem to follow that every state no matter what its form of government is constitutional in character. But this would leave no basis for the fundamental distinction between constitutional and non constitutional—or what is usually called absolute royal or "despotic"—government.

That basic distinction among forms of government is as old as Plato and Aristotle. It is first made by Plato in the *Statesman* in terms of the role of law in government. It occurs at the very opening of Aristotle's *Politics* with his insistence on the difference between the King and the statesman and between royal and political government. But Locke seems to go further than the ancients when he says that "absolute monarchy" is inconsistent with civil society and so can be no form of civil government at all.

In addition to affirming the gravity of the distinction between constitutional and non constitutional government he seems to be denying that the latter can constitute the form of a truly civil society as opposed to a domestic society or the primitive patrarchate of a tribe. Yet Locke obviously does not deny the historic fact that there have been communities which otherwise appear to be states, that have the character or form determined by absolute

government His point therefore seems to be that among types of government absolute monarchy does not fit the nature of civil society

If constitution is used merely as a synonym for form or type then even a state under absolute monarchy or despotic government can be said to have a constitution Since every state is of some type it can be said that it has a certain constitution or that it is constituted in a certain way If however we use the word constitution to conform to the distinction between constitutional and non constitutional government we are compelled to say that there are states which do not have constitutions

With this distinction in mind the statement that the constitution is the form of the state takes on a different and more radical meaning It signifies that there are communities larger than and distinct from the family or the tribe which cannot be called states in the strict sense because they do not have constitutions Hegel for instance points out that it would be contrary even to commonplace ideas to call patriarchal conditions a constitution or a people under patriarchal government a state or its independence sovereignty In such conditions what is lacking he writes is the objectivity of possessing in its own eyes and in the eyes of others a universal and universally valid embodiment in laws Without such an objective law and an explicitly established rational constitution its autonomy is not sovereignty

From this it would appear that a despotically governed community such as ancient Persia is a political anomaly It is intermediate between the family and the state for it is like a state in its extent and in the size and character of its population yet it is not a state in its political form The truly political community is constitutionally organized and governed In this sense the English words political and constitutional become almost interchangeable and we can understand how these two English words translate a single word in Greek political discourse

As THE FORM of the state the constitution is the principle of its organization Whether writ

ten or unwritten whether a product of custom or explicit enactment a constitution Aristotle writes is the organization of offices in a state and determines what is to be the governing body and what is the end of each community

The idea of political office—of officials and official status—is inseparable from the idea of constitution That is why the concept of citizenship is also inseparable from constitution As the chapter on CITIZEN indicates citizenship is the primary or *indefinite* office set up by a constitution Citizenship is always the prerequisite for holding any other *more definite* office in a constitutional government from juryman to chief magistrate In specifying the qualifications for citizenship a constitution sets the minimum qualifications for all other offices which usually though not always demand more than citizenship of the man who is to fill them

A political office represents a share of political power and authority Those are to be called offices Aristotle explains to whom the duties are assigned of deliberation about certain measures and of judging and commanding especially the last for to command is the especial duty of a magistrate As representing a share of political power and authority a political office can be said to constitute a share of sovereignty That would not seem to be true however for those who like Rousseau maintain that sovereignty is indivisible Yet Rousseau also admits that each magistrate almost always charged with some government function and exercises a function of sovereignty

Since it is an arrangement of offices a constitution is therefore also a division or partition of the whole sovereignty of government—or at least of the exercise of sovereignty—into units which have certain functions to perform and which must be given the requisite power and authority to perform them These units are political offices defined according to the functions and vested with a certain power and authority depending on their place and purpose within the whole

Hamilton's maxim that every power ought to be in proportion to its object formulate the equation by which the function of an office or its duties determines its rights and power

privileges and immunities. And except for the provision of a temporary dictatorship in the early Roman constitution or its modern constitutional equivalent in emergency grants of power political offices under constitutional government always represent limited amounts of power and authority—limited in that each is always only a part of the whole.

A constitution defines and relates the various political offices. It determines the qualifications of office-holders. But it does not name the individuals who from all those qualified shall be selected for any office. Because its provisions are thus sort of general they a constitution has the character of law. This is equally true of written and unwritten constitutions of those shaped by custom and those enacted by constituent assemblies.

Unlike all other man-made laws a constitution is the law which creates and regulates government itself rather than the law which a government creates and by which it regulates the conduct of men their relation to one another and to the state. This is perhaps the basic distinction with regard to the laws of the state.

The fundamental law in every commonwealth says Hobbes is that which being taken away the commonwealth faileth and is utterly dissolved. Montesquieu distinguishes what he calls the law politic which constitutes the state from ordinary legislation and Rousseau likewise divides the laws into the political or fundamental laws and the civil laws—those which determine the form of the government and those which the government once it is constituted enacts and enforces.

In addition to being the source of all other positive laws of the state—for it sets up the very machinery of lawmaking—a constitution is fundamental law in that it establishes the standard of legality by which all subsequent laws are measured. Aristotle observes that the justice or injustice of laws varies of necessity with constitutions. What may be a just enactment in one state may be unjust in another according to the difference of their constitutions.

In American practice and that modeled upon it a law which violates the letter or spirit of the

constitution is judged to be unconstitutional and is deprived thereby of the authority of law.

Every act of a delegated authority Hamilton writes in *The Federalist* contrary to the tenor of the commission under which it is exercised is void. No legislative act therefore contrary to the Constitution can be valid. To deny this would be to affirm that the deputy is greater than his principal that the servant is above his master that the representatives of the people are superior to the people themselves that men acting by virtue of powers may do not only what their powers do not authorize but what they forbid.

The conception of a constitution as a law or set of laws antecedent to all acts of government inevitably raises the question of how or by whom constitutions are made. If the provisions of a constitution were precepts of natural law they would according to the theory of natural law be discovered by reason not positively instituted. But though constitutions have the character of positive law they cannot be made as other positive laws are made—by legislators i.e. men holding that office under the constitution.

The generally accepted answer is that a constitution is made by the people who form the political community. But as Madison observes some evidence exists to the contrary. It is not a little remarkable he writes that in every case reported by ancient history in which government has been established with deliberation and consent the task of framing it has not been committed to an assembly of men but has been performed by some individual citizen of pre-eminent wisdom and approved integrity. He cites many examples from Plutarch to support this observation but he adds the comment that it cannot be ascertained to what extent these lawgivers were clothed with the legitimate authority of the people. In some cases however he claims that the proceeding was strictly regular.

The writers of *The Federalist* are of course primarily concerned with a constitution that is not the work of one man but the enactment of a constituent assembly or constitutional convention. From their knowledge of British law they are also well aware that a constitution may

government His point therefore seems to be that among types of government absolute monarchy does not fit the nature of civil society

If constitution is used merely as a synonym for form or type then even a state under absolute monarchy or despotic government can be said to have a constitution Since every state is of some type it can be said that it has a certain constitution or that it is constituted in a certain way If however we use the word constitution to conform to the distinction between constitutional and non constitutional government we are compelled to say that there are states which do not have constitutions

With this distinction in mind the statement that the constitution is the form of the state takes on a different and more radical meaning It signifies that there are communities larger than and distinct from the family or the tribe which cannot be called states in the strict sense because they do not have constitutions Hegel for instance points out that it would be contrary even to commonplace ideas to call patriarchal conditions a constitution or a people under patriarchal government a state or its independence sovereignty In such conditions what is lacking he writes is the objectivity of possessing in its own eyes and in the eyes of others a universal and universally valid embodiment in laws Without such an objective law and an explicitly established rational constitution its autonomy is not sovereignty

From this it would appear that a despotically governed community such as ancient Persia is a political anomaly It is intermediate between the family and the state for it is like a state in its extent and in the size and character of its population yet it is not a state in its political form The truly political community is constitutionally organized and governed In this sense the English words political and constitutional become almost interchangeable and we can understand how these two English words translate a single word in Greek political discourse

As THE FORM of the state the constitution is the principle of its organization Whether writ

ten or unwritten whether a product of custom or explicit enactment a constitution Aristotle writes is the organization of offices in a state and determines what is to be the governing body and what is the end of each community

The idea of political office—of officials and official status—is inseparable from the idea of constitution That is why the concept of citizenship is also inseparable from constitution As the chapter on CITIZEN indicates citizenship is the primary or indefinite office set up by a constitution Citizenship is always the prerequisite for holding any other more definite office in a constitutional government from juryman to chief magistrate In specifying the qualifications for citizenship a constitution sets the minimum qualifications for all other offices which usually though not always demand more than citizenship of the man who is to fill them

A political office represents a share of political power and authority Those are to be called offices Aristotle explains to which the duties are assigned of deliberating about certain measures and of judging and commanding especially the last for to command is the especial duty of a magistrate As representing a share of political power and authority a political office can be said to constitute a share of sovereignty That would not seem to be true however for those who like Rousseau maintain that sovereignty is indivisible Yet Rousseau also admits that each magistrate is almost always charged with some governmental function and exercises a function of sovereignty

Since it is an arrangement of offices a constitution is therefore also a division or partition of the whole sovereignty of government—or at least of the exercise of sovereignty—into units which have certain functions to perform and which must be given the requisite power and authority to perform them These units are political offices defined according to their functions and vested with a certain power and authority depending on their place and purpose within the whole

Hamilton's maxim that every power ought to be in proportion to its object formulates the equation by which the function of an office or its duties determines its rights and powers

be arbitrary and at pleasure so it ought to be  
revised by established and promulgated laws  
both the people may know their duty  
and be safe and secure within the limits of the  
law and the rulers too kept within their due  
bounds.

As Locke states the distinction between  
government by laws and government by men  
it seems to be identical with the distinction be-  
tween constitutional and non constitutional  
government.

In the latter an individual man  
invests himself with sovereignty and as sover-  
eign, puts himself above all human law being  
both its source and the arbiter of its legality.  
Such government is absolute for nothing limits  
the power the sovereign man exercises as a  
prerogative vested in his person. In constitu-  
tional government men are not sovereigns but  
office-holders having only a share of the sov-  
ereignty. They rule not through *de facto* pow-  
er but through the judicial power which is  
vested in the office they hold. That power is  
both created and limited by the law of the con-  
stitution which defines the various offices of  
government.

ALTHOUGH ABSTRACTLY or in theory absolute  
and constitutional government are clearly dis-  
tinct—more than that opposed—political his-  
tory contains the record of intermediate types.  
These can be regarded as imperfect embody-  
ments of the principle of constitutionality, or  
as attenuations of absolute rule by consti-  
tutional encroachments. Despite their incompati-  
bility in principle historic circumstances have  
managed to combine absolute with constitu-  
tional government. It is this combination which  
mediaeval jurists and philosophers call the  
mixed regime or the *regimen regale et politi-  
cum* royal and political government.

It may be thought that a foreshadowing of  
the mediæval mixed regime can be found in  
Plato's *Laws* in the passage in which the  
Athenian Stranger says that monarchy and  
democracy are the two mother forms of states  
from which the rest may be truly derived. He  
then asserts that to combine liberty with re-  
sponsibility must have both these forms of gov-  
ernment in a mea ut. Since the Persian des-  
potism is cited as the highest form of monar-  
chy and the Athenian constitution as the archetypal

type of democracy the combination proposed  
would seem to be a mixture of absolute with  
constitutional government. But the Athenian  
Stranger also says that there ought to be no  
great and unmixed powers if the arbitrary is  
to be avoided and since the whole tenor of the  
book as indicated by its title is to uphold the  
supremacy of law it is doubtful that a truly  
mixed regime is intended—a government which  
is partly absolute and partly constitutional.

Aristotle furthermore gives us reason to  
think that such a mixture would be unthinkable  
to a Greek. At least in his own vocabulary  
the terms royal and political are as contradictory  
as round and square. Royal or kingly govern-  
ment for Aristotle is absolute monarchy or  
the arbitrary rule of a sovereign over all. In  
royal government there are no political offices  
and no citizens. The ruler is sovereign in his  
own person and the ruled are subject to his  
will which is both the source of law and  
exempt from all legal limitations.

To Aristotle political government means  
pure constitutionalism. It exists only where  
the citizens rule and are ruled in turn for  
the state is founded upon the principle of  
equality and likeness the citizens think they  
ought to hold office by turns. To the generic  
form of constitutional government Aristotle  
sometimes gives the name of polity though  
he also uses this name for the mixed constitu-  
tion which combines democratic with oligar-  
chical criteria for citizenship and public office.  
The mixed constitution is not to be confused  
with the mixed regime for it is a mixture of  
different constitutional principles not of con-  
stitutionalism itself with absolute government.  
When the word polity signifies constitutional  
government generally it has the meaning  
which the Romans express by the word re-  
public and which the constitutionalists of the  
18th century call free government.

The distinctive characteristics of such gov-  
ernment—whether it is called political repub-  
lican constitutional or free—lie in the fact  
that the citizens are both rulers and ruled; that  
no man—not even the chief magistrate—is above  
the law that all political power or authority is  
derived from and limited by the constitution  
which being popular in origin cannot be  
changed except by the people as a whole.

sometimes be the product of custom growing and altering with change of custom But how ever it is exercised the constitutive power is held by them to reside in the constituents of the state the sovereign people This power may be exercised through force of custom to pro duce an unwritten constitution or through deliberative processes to draft a written one but it can never be exercised by a government except with popular consent since all the powers of a duly constituted government derive from its constitution In the American if not the British practice the amendment of the con stitution also involves at least indirectly an appeal to the people

Rousseau assigns the constitutive power to a mythical figure he calls the legislator or the law giver describing him as the man who sets up the Republic Yet Rousseau says of this special office that it nowhere enters into the constitution He thus reaffirms the essen tial point that a constitution cannot create the office of constitution making

These remarks in the *Social Contract* have another significance Rousseau tries to distin guish the formation of a government by the constitution (the political or fundamental law made by the legislator) from the formation of the state by the social contract entered into by the people in their original act of association But is not the constitution also a formative con tract or convention? If it is popular in origin either through custom or enactment is there more than a verbal difference between these two contracts—the one which establishes a political society and the one which establishes its government?

For Hobbes and seemingly also for Locke the compact by which men abandon the state of nature and establish a civil society results at the same time in the establishment of a govern ment It is Hobbes writes as if every man should say to every man I authorize and give my right of governing my self to this Man or to this Assembly of men on this condition that thou give up thy right to him and author ize all his actions in like manner According to Rousseau there is only one contract in the State and that is the [original] act of associa tion For him the institution of government is not a contract

The reality and significance of the difference between these three political philosophies would seem to depend on the precise historical meaning each gives to the hypothesis of men living in a state of nature prior to political association If prior to the state men live in non political societies and if the state as opposed to the family or the despotically ruled community begins to exist only when it is constituted then the formation of the state and the formation of its government would seem to be the product of a single convention

THE PRINCIPLE OF constitutionality is also necessary in order to understand the familiar distinction between government by laws and government by men Except for the divine sort of government which is above both law and lawlessness Plato employs 'the distinction of ruling with law or without law' to divide the various forms of government into two groups

The principle of law and the absence of law will bisect them all the Eleatic Stranger says in the *Statesman*

In the ordinary meaning of law as an instru ment of government it is difficult to conceive government by laws without men to make and administer them or government by men who do not issue general directives which have the character of law Government always involves both laws and men But not all government rests upon the supremacy of law a supremacy which consists in the equality of all before the law and the predominance of regular law as opposed to arbitrary decision Nor is all government based upon a law that regulates the offi cials of government as well as the citizens, so determines the legality of official acts legislative judicial or executive That law is of course the constitution

Locke makes a distinction between govern ing by absolute arbitrary power and govern ing by settled standing laws It is his conten tion that whatever form the common wealth is under the ruling power ought to govern by declared and received laws and not by extemporary dictates and undetermined resolutions for then man and will be in a worse condition than in a state of Nature All the power the government has being onl for the good of the society as it ought not

anized into an objective constitution but only  
-ual monarchy

It is not until the 18th century that the  
last vestige of royal power comes to be re-  
garded as unusual to law For Rousseau every  
legitimate government is republican for him  
the only rightful Constitution is that of a  
pure Republic which in his view can only  
be constituted by a representative system of the  
people The writers of The Federalist take the  
same stand They interpret the aversion of the  
people to monarchy as signifying their espousal  
of purely constitutional or republican govern-  
ment In the tradition of the great books, only  
Hegel speaks thereafter in a contrary vein.  
Constitutional monarchy represents for him  
the essence of constitutionalism and the only  
perfect expression of the idea of the state

Because modern republics and even modern  
constitutional or limited monarchies have de-  
veloped gradually or by revolution out of mixed  
regimes and because this development came  
as a reaction against the increasing absolutism  
or despotism of kings the principle of constitu-  
tionality has been made more effective in mod-  
ern practice than it was in the ancient world  
In addition to asserting limitations upon gov-  
ernments constitutions have also provided  
means of controlling them They have been  
given the force as well as the authority of  
positive law They have made office holders ac-  
countable for their acts and through such ju-  
dicial processes as impeachment and such politi-  
cal devices as frequent elections and short  
terms of office they have brought the adminis-  
tration of government within the purview of  
the law

Following Montesquieu the Federalists rec-  
ommend the separation of powers with checks  
and balances as the essential means of afford-  
ing constitutional limitations of office and of pre-  
venting one department of government from  
overrunning the power of another The citizens are  
further protected from the misuse of power by  
constitutional declarations of their rights and  
immunities and constitutional government is  
itself safeguarded from revolutionary violence  
by such institutions as judicial review and by  
the availability of the amendment power as a  
means of changing the constitution through  
due process of law

In the history of political change it is neces-  
sary to distinguish change from or to constitu-  
tional government and within the sphere of  
constitutional government the change of consti-  
tutions

Republics are set up and constitutions estab-  
lished by the overthrow of despots or with their  
abdication Republics are destroyed and consti-  
tutions overthrown by dictators who usurp the  
powers of government Violence or the threat  
of violence usually attends these changes

The other sort of change may take place in  
two ways either when one constitution re-  
places another as frequently occurs in the revo-  
lutions of the Greek city-states or when an  
enduring constitution is modified by amend-  
ment as is customary in modern republics.  
Every constitutional change is in a sense revo-  
lutionary but if it can be accomplished by due  
process of law violence can be avoided

All the changes in high constitutional gov-  
ernment or constitutions are involved raise  
fundamental questions of justice Is republican  
government always better than absolute mon-  
archy and the mixed regime—better in the  
sense of being more just better because it gives  
men the liberty and equality they justly de-  
serve? Is it better relative to the nature and  
condition of certain peoples but not all or of a  
people at a certain stage of their development  
but not always? In what respects does one con-  
stitution embody more justice than another?  
What sorts of amendment or reform can rectify  
the injustice of a constitution? Without an-  
swering such questions we cannot discriminate  
between progress and decline in the history of  
constitutionalism

Divergent answers will of course be found in  
the great books Among the political philoso-  
phers there are the defenders of absolutism  
and those who think that royal government is  
most like the divine the exponents of the su-  
premacy of the mixed regime the republicans  
who insist that nothing less than constitutional  
government is fit for free men and equals And  
there are those who argue that the justice of  
any form of government must be considered  
relative to the condition of the people so that  
republican government may be better only in  
some circumstances not in all

The issue arising from these conflicting views

It is perhaps only in the Middle Ages that we find the mixed regime in actual existence

That rule is called politic and royal Aquinas writes by which a man rules over free subjects who though subject to the government of the ruler have nevertheless something of their own by reason of which they can resist the orders of him who commands These words seem to present an accurate picture of the peculiarly mediaeval political formation which resulted from the adaptation of Roman law (itself partly republican and partly imperial) to feudal conditions under the influence of local customs and the Christian religion

The mediaeval mixed regime is not to be confused with modern forms of constitutional monarchy any more than with the mixed constitution or polity of the Greeks The so-called limited monarchy or kingship according to law Aristotle remarks is not a distinct form of government The chapter on *MONARCHIA* deals with the nature of constitutional monarchy and its difference from the mixed regime as well as its relation to purely republican government The mediaeval king was not a constitutional monarch but a sovereign person in one sense above the law and in another limited by it

To the extent that he had powers and prerogatives unlimited by law the mediaeval king was an absolute ruler He was as Aquinas says quoting the phrase of the Roman jurists *legibus solitus*—exempt from the force of all man-made law Aquinas also describes him as above the law insofar as when it is expedient he can change the law and rule without it according to time and place Yet he was also bound by his coronation oath to perform the duties of his office first among which was the maintenance of the laws of the realm—the immemorial customs of the people which define their rights and liberties The king's subjects could be released from their oath of allegiance by his malfeasance or dereliction in office

To this extent then the mediaeval king was a responsible ruler and the mixed regime was constitutional Furthermore the king did not have jurisdiction over customary law yet where custom was silent the king was free to govern absolutely to decree what he willed and even to innovate laws

MEDIEVAL IN ORIGIN the institution of a government both royal and political or the Fortescue describing England in the 14th century called a political kingdom exerted great influence on modern constitutional developments As late as the end of the 17th century Locke's conception of the relation of king and parliament royal prerogative and legal limitations may emphasize the primacy of law but it does not entirely divest the king of personal sovereignty Locke quotes with approval the speech from the throne in 1609 in which James I said that the king binds himself by a double oath to the observation of the fundamental laws of his kingdom Tacitly as by being a king and so bound to protect a nation the people as the laws of his kingdom assert expressly by his oath at his coronation To this extent the British kingdom is as Fortescue had said political But the king also retains the prerogative to dispense with law and to govern in particular matters by decree apart from law and to this extent the government still remains royal

Locke recognizes the difficulty of combining the absolute power of the king in administration with the limitations on that power represented by Parliament's jurisdiction over the laws which bind the king To the question Who shall be judge of the right use of the royal prerogative? he replies that between an executive power in being with such prerogative and a legislative that depends upon his will so that convening there can be no judge on earth The people have no other remedy but to appeal to heaven

Montesquieu as well as Locke can conceive monarchy as distinct from despotism in no other terms than those of the mixed regime He separates despotism as lawless or arbitrary and absolute government from all forms of government by law and divides the latter into monarchies and republics Montesquieu notes that the ancients had no notion of the kind of monarchy which while it is legal government is not purely constitutional in the sense of being republican He calls this kind of monarchy Gothic government and as Hegel later points out it is clear that by monarchy he understands not the patriarchal or any ancient type nor on the other hand the type or

the theory of representation. That begins in medieval treatises which recognize the consultative or advisory function of those who represent the nobles and the commoners at the king's court. But it is only in recent centuries—when legislation has become the exclusive function of representative assemblies—that the idea of representation and the theory of its practice assume a place of such importance that a political philosopher like Mill does not hesitate to identify representative with constitutional government.

## OUTLINE OF TOPICS

TOPIC	P. CT.
1 The difference between government by law and government by men—the nature of constitutional government	242
2 The notion of a constitution	243
2a The constitution as the form or organization of a political community—arrangement of offices, division of functions	
2b The constitution as the fundamental law—its relation to other laws, as a source or measure of legality or justice	
3 The relation of constitutional government to other forms of government	
3a The combination of constitutional with absolute government—the mixed regime, constitutional or limited monarchy	
3b The merits of constitutional government compared with royal government and the mixed regime	244
The constitutional conception of political office—the qualifications and duties of public officials	
4 The diversity of constitutions among the forms of government	245
4a The justice of different constitutions—the extent and character of citizenship and reach	
4b The mixed constitution—its advantages	
5 The origin of constitutions—the law giver—the social contract—the constituent assembly	246
, The preservation of constitutions—factors tending toward their dissolution	
5a The relative stability of different types of constitutions	
5b The safeguards of constitutional government—bills of rights, separation of powers, impeachment	247
6 The change of constitutions	
6a Methods of changing a constitution—revolution and document	
6b The violation and overthrow of constitutional government	248
7 The theory of representation	
7a The functions and duties of representatives—their relation to their constituents	
7b Types of representation—diverse methods of selecting representatives	
8 The origin, growth, and structures of constitutional government	249

concerning constitutional and absolute government is treated in the chapters on *CITIZEN MONARCHY* and *TYRANNY*. But one other issue remains to be discussed here. It concerns the comparative justice of diverse constitutions. Constitutions can differ from one another in the way in which they plan the operations of government or in the qualifications they set for citizenship and public office. Usually only the second mode of difference seriously affects their justice.

In Greek political life the issue of justice as between the democratic and the oligarchical constitution is a conflict between those who think that all free men deserve the equality of citizenship and the opportunity to hold office and those who think it is unjust to treat the rich and the poor as equals. The latter insist that citizenship should be restricted to the wealthy and that the magistracies should be reserved for men of considerable means.

Finding justice and injustice on both sides Aristotle favors what he calls the *mixed constitution*. This unites the justice of treating free men alike so far as citizenship goes with the justice of discriminating between rich and poor with respect to public office. Such a mixture he writes may be described generally as a fusion of oligarchy and democracy since it attempts to unite the freedom of the poor and the wealth of the rich. The mixed constitution especially if accompanied by a numerical pre dominance of the middle class seems to him to have greater stability as well as more justice than either of the pure types of constitution which oppressive to either poor or rich provoke revolution.

In modern political life the issue between oligarchy and democracy tends toward a different resolution. The last defenders of the oligarchical constitution were men like Burke, Hamilton, and John Adams in the 18th century. Since then the great constitutional reforms have progressively extended the franchise almost to the point of universal suffrage. These matters are of course further treated in the chapters on *DEMOCRACY* and *OLIGARCHY*.

**POLITICAL REPRESENTATION** with a system of periodic elections seems to be indispensable to constitutional government under modern con

ditions. The territorial extent and populousness of the nation state is compared with the ancient city state makes impossible direct participation by the whole body of citizens in the major functions of government.

Considering the ancient republics of Sparta, Rome and Carthage the writers of *The Federalist* try to explain the sense in which the principle of representation differentiates the American republic from these ancient constitutional governments. The principle of representation they say is as neither unknown to the ancients nor wholly overlooked in the political constitutions. The true distinction between these and the American governments lies in the total exclusion of the people in their collective capacity from any share in the latter and not in the total exclusion of the representatives of the people from the administration of the former.

The Federalists then go on to say that the distinction thus qualified must be admitted to leave a most advantageous superiority in favor of the United States. But to insure its full effect we must be careful not to separate it from the other advantage of an extensive territory. For it cannot be believed that any form of representative government could have succeeded within the narrow limits occupied by the democracies of Greece.

In their opinion representative government is not merely necessitated by the conditions of modern society but also has the political advantage of safeguarding constitutional government from the masses. As pointed out in the chapter on *ARISTOCRACY* where the theory of representation is discussed the officers of government chosen by the whole body of citizens are supposed—at least on one conception of representation—to be more competent in the business of government than their constituents. It is in these terms that the Federalists advocate what they call republican government as opposed to pure democracy.

Like the idea of political offices the principle of representation seems to be inseparable from constitutionalism and constitutional government. Though the principle appears to certain extent in ancient republics—whether oligarchies or democracies—ancient political writing does not contain a formal discussion of

the theory of representation. That begins in mediaeval treatises which recognize the consultative or advisory function of those who represent the nobles and the common, at the king's court. But it is only in recent centuries—when evolution has become the exclusive function of

representative assemblies—that the idea of representation and the theory of its practice assume a place of such importance that a political philosopher like Mill does not hesitate to identify representative with constitutional government.

a specifically human strength. Courage does not consist only in conquering fear and in with holding the body from flinching no matter what the risk of pain. It consists at least as much in steeling the will to reinforce its resolutions, and turning the mind relentlessly to seek or face the truth.

Civil no less than martial action requires courage. Years of empire Marcus Aurelius summons courage each day for the performance of an endless round of duties. "In the morning, when thou risest unwilling," he reminds himself, let this thought be present—I am risen, to the work of a human being. How he con certes the work of an emperor he makes plain.

Let the deity which is in thee be the guardian of a living, being manly and of ripe age and engaged in matter political, and a Roman, and a ruler who has taken his post like a man waiting for the signal which summons him from life and ready to go, having need neither of oath nor of any man's testimony. The burdens are heavy, the task difficult but not impossible, for a man "can live well even in a palace."

Civil courage is as necessary for the citizen as for the ruler. This virtue in Mill's opinion is especially necessary for citizens of a free government. "A people may prefer a free government," he writes, but if, from indolence or carelessness, or cowardice or want of public spirit, they are unequal to the exertions necessary for preserving it, if they will not fight for it when it is directly attacked, if they can be deluded by the artifices used to cheat them out of it, if by momentary discouragement or temporary panic or a fit of enthusiasm for an individual, they can be induced to lay their liberties at the feet even of a great man, or trust him with powers which enable him to subvert their institutions, in all these cases they are more or less unfit for liberty, and though it may be for their good to have had it even for a short time, they are unlikely long to enjoy it.

The courage or pusillanimity of a people is sometimes regarded as the cause, and sometimes as the effect of their political institutions. "The Englishmen of Europe," Hippocrates writes, are more courageous than those of Asia, for a climate which is always the same induces indolence but a changeable climate labours exertions, both of body and mind, and from rest

and indolence cowardice is engendered and from laborious exertions and pains, courage. This, according to Hippocrates, partly explains why the Asiatics readily submit to despotism and why the Europeans fight for political liberty. But the character of the Europeans, he adds, is also the result of their institutions because they are not governed by kings—for where men are governed by kings, there they must be very cowardly—and they will not readily undergo dangers in order to promote the power of another but those that are free undertake dangers on their own account—and thus their institutions contribute not a little to their courage.

For Hegel, on the contrary, civic courage consists in undertaking dangers, even to the point of sacrifice for the state. Moreover for him true courage is entirely a civic virtue. "The intrinsic worth of courage as a disposition of the mind," he writes, is to be found in the genuine absolute final end—the sovereignty of the state. The work of courage is to actualize this final end, and the means to this end is the sacrifice of personal actuality. Though he admits that courage is multiform, he insists that "the mettle of an animal or a brigand, courage for the sake of honor, the courage of a knight, these are not true forms of courage. The true courage of civilized nations is readiest for sacrifice in the service of the state so that the individual counts as only one amongst many."

THE WORK OF MAN IS LEARNING AS WELL AS ACTION. Man has a duty to the truth as well as to the state. The ability to face without flinching the hard questions reality can put constitutes the temper of a courageous mind. "The huge world that girdles us about," William James writes, "puts all sorts of questions to us, and tests us in all sorts of ways. Some of the tests we meet by actions that are easy and some of the questions are answered in articulately formulated words. But the deepest question that is ever asked admits of no reply but the dumb turning of the will and tightening of our heart-strings as we say 'Yes, I will; I can have it so.' When a dreadful object is presented or when life as a whole turns up its dark abysses to our view then the worthless ones among us lose their hold on the situation altogether. But the heroic

## Chapter 13 COURAGE

### INTRODUCTION

THE heroes of history and poetry may be cruel violent self seeking ruthless intemperate and unjust but they are never cowards They do not falter or give way They do not despair in the face of almost hopeless odds They have the strength and stamina to achieve what ever they set their minds and wills to do They would not be heroes if they were not men of courage

This is the very meaning of heroism which gives the legendary heroes almost the stature of gods In the Homeric age they do in fact contend with gods as well as men The two Homeric epics especially the *Iliad* are peopled with men who cannot be daunted or daunted In Tennyson's poem Ulysses now resting in Ithaca remembering the years at Troy and the long voyage home says to his companions

Some work of noble note may yet be done  
Not unbecoming men that strove with Gods  
and though

We are not now that strength which in old days  
Moved earth and heaven that which we are we are  
One equal temper of heroic hearts,  
Made weak by time and fate but strong in will  
To strive to seek to find and not to yield

In the *Iliad* courage is the quality above all others which characterizes the great figures of Achilles and Hector Ajax Patroclus and Diomedes Agamemnon and Menelaus The only other quality which seems to be equally prized and made the subject of rivalry and boast is cunning—the craft of Odysseus that man of many devices and the cleverness in speech of Nestor Yet the best speech is only the prelude to action and except for the night expedition of Odysseus and Diomedes into the Trojan camp the great actions of the *Iliad* are unplanned deeds of prowess—stark not stealthy

The heroes have boundless passions and fear is among them When they are called fearless

it is not because nothing affrights them or turns their blood cold Fear seizes them a does not with all its bodily force They are fearless only in the sense that they do not act afraid to act Their courage is always equal to the peril sensed or felt so that they can perform what must be done as if they had no fear of pain or death

Yet brave men often speak of course as if were fearlessness and mark the coward as one who is undone by fear An ambush Indomitus says in the *Iliad* will show who is cowardly and who is brave the coward will draw color at every touch and turn he is full of fear and keeps shifting his weight first on one leg and then on the other his heart beats fast he thinks of death and one can hear the chattering of his teeth The brave man master, fear will appear to be fearless

This is the courage of men of action men in war found not only in the heroes of Troy's siege but in the stalwarts of all other battles Leonidas at Thermopylae Aeneas and Turnus engaged in single combat the conqueror in Plutarch the warrior nobility in Shakespeare the civilized Prince Andrew and young Ross in *War and Peace* It is the sort of courage which goes with physical strength with fears of endurance and as signified by the root meaning of fortitude which is a synonym for courage it is a reservoir of moral or spiritual strength to sustain action even when flesh and blood can carry on no further Such courage is a virtue in the primary sense of the Latin word *courage* manliness the spirit or strength of spirit required to be a man

THERE ARE OTHER sorts of courage The courage of the tragic hero of Oedipus and Antigone goes with strength of mind not body This perhaps even more than being lion hearted

hose duty it is to make real the ideality in  
it within itself, i.e. to sacrifice itself. But  
hereas for Hegel courage seems to be the fore-  
most political virtue Plato puts it last in the  
order of goods. Wisdom is chief the Athenian  
Stranger says in the *Laws* next follows  
temperance and from the union of these two  
with courage springs justice and fourth in the  
scale of virtue is courage.

In the context of a different psychological  
analysis, and a theory of the virtues which con-  
siders them primarily as habits, Aristotle's con-  
cept of courage differs from Plato's in a  
number of respects. It is most closely allied  
with temperance. These two virtues together  
belong to the irrational part of the soul—the  
passions or appetites—and are concerned with  
our attitude to "and pleasure and pain. They  
discipline us, both in feeling and action with  
regard to the pleasurable objects of desire and  
the painful objects of fear or aversion. Aris-  
totle seems to think courage more praiseworthy  
than temperance for it is harder to face what  
is painful than to abstain from what is pleasant.

Just as the temperate man is one who habit-  
ually forgoes certain pleasures and seeks other  
pleasures moderately for the sake of achieving  
some greater good so the courageous man is one  
who can at any time endure pain and hardship  
or overcome fear of danger and death in order  
to achieve a paramount end. Since death is the  
most terrible of all things, Aristotle declares  
that properly he will be called brave who is  
fearless in face of a noble death and of all  
emergencies that is to say death. But it must  
be for a noble end that the brave man endures  
and acts as courage demands.

The paramount end the greatest good which  
the model of temperance and the endurance  
of courage serve is for Aristotle happiness.  
Yet through their relation to justice  
which concerns the good of others and the well-  
fare of the state temperance and courage help  
a man to perform his social duties whether  
as ruler or citizen in peace or war. The man  
who acts lawfully will not only be just but also  
courageous and temperate for in Aristotle's  
view the law bids us do both the acts of a  
brave man e.g. not to desert our post not tak-  
ing flight nor throw away our arms, and those of  
a temperate man e.g. not to commit adultery,

not to gratify one's lust. Not only may the  
law-abiding man be called upon to be coura-  
geous in the respects which Aristotle indicates,  
but it may sometimes take great courage to up-  
hold the law itself against many temptations to  
the contrary. After the death of Moses the  
Lord spake unto Joshua and said unto him  
Be thou strong and very courageous that  
thou mayest observe to do according to all the  
law which Moses my servant commanded thee  
turn not from it to the right hand or to the  
left.

The fourth virtue with which courage tem-  
perance and justice are associated in the con-  
duct of private or public life is prudence or  
practical wisdom." Though Aristotle classifies  
prudence as an intellectual virtue consisting in  
the capacity for making a right judgment about  
things to be done he also regards prudence as  
inseparable in origin and exercise from these  
other three virtues which he calls moral  
rather than intellectual. Later writers call  
the four virtues taken together—courage tem-  
perance justice and prudence—the cardinal  
virtues in order to say as Aquinas explains,  
that the whole of morality hinges upon them.

The theory of the cardinal virtues and of  
their connection with one another in such wise  
that none can be perfect in the absence of the  
others is treated in the chapter on VIRTUE.  
The chapters on JUSTICE, TEMPERANCE and  
PRUDENCE discuss the doctrine that each of  
these virtues is only a part of virtue which  
must be integrated with the other parts. The  
special role which prudence plays in relation to  
virtues like courage and temperance—at least  
according to Aristotle's view that it is not pos-  
sible to be good in the strict sense without prac-  
tical wisdom nor practically wise without moral  
virtue—must be reserved for the chapter deal-  
ing with that virtue. Nevertheless it is neces-  
sary to consider here how its dependence on  
prudence may qualify the meaning or nature of  
courage.

The connection which some writers see be-  
tween courage and prudence affects the defini-  
tion of courage in two ways. The first involves  
the doctrine of the mean which enters into the  
definition of all the moral virtues but espe-  
cially courage and temperance.

mind does differently It can face them if necessary without for that losing its hold upon the rest of life The world thus finds in the heroic man its worthy match and mate He can stand this Universe

Not only in answering questions but in asking them courage is required The story which St Augustine tells in the *Confessions* of his persistent questioning of doctrines and dogmas his refusal to rest in any creed which did not wholly satisfy his mind is a story of speculative courage capped by the fortitude with which he bore the agony of irresolution and doubt

Learning is never an easy enterprise nor truth an easy master The great scientists and philosophers have shown the patience and perseverance of courage in surmounting the social hardships of opposition and distrust as well as the intellectual difficulties which might discourage men less resolved to seek and find the truth The great religious martyrs as indomitable in their humility as soldiers are in daring have been as resolute—never yielding to a despair which would have dishonored their faith

In all these types of fortitude different motivations are apparent as diverse as the forms which courage takes under the various demands of life Not all the forms of courage may be equally admirable partly because they are unequal in degree but also partly because the courageous acts themselves or the purposes for which fortitude is needed are not of equal moral worth Yet the essence of courage seems to be the same throughout It sustains the honor of Don Quixote and in some sense even of Sir John Falstaff it burnishes the fame of Alexander and Caesar it fortifies Socrates and Galileo to withstand their trials Whether in the discharge of duty or in the pursuit of happiness courage confirms a man in the hard choices he has been forced to make

AS THE CHAPTER ON VIRTUE indicates the traditional theory of the moral qualities places courage or fortitude among the four principal virtues The other three are temperance justice and either wisdom or prudence according to the enumeration of different writers

Plato names these virtues when in the *Republic* he compares the parts of the state with the parts of the soul The same principles

which exist in the State exist also in the individual Socrates says and they are three in number There is one with which a man rises

the rational part of the soul another which he loves and hungers and thirsts after the flutterings of any other desire—the rational or appetitive the ally of sundry pleasures and satisfactions The third part is passion or spirit which when not corrupted by bad education is the natural auxiliary of reason

Corresponding to these three parts of the soul there are or should be according to Platon three classes in the state the guardians or nobles the husbandmen and artisans or the workers and the auxiliaries or the soldiers

The virtues which belong to the several parts of the soul also belong to the corresponding parts of the state Wise is the man Socrates declares who has in him that little part which rules and which proclaims commands the part too being supposed to have a knowledge what is for the interest of each of the three parts and of the whole Courageous is he whose spirit retains in pleasure and in pain the commands of reason about what he ought or ought not to fear

Temperance however instead of being exclusively the perfection of one part pervades the whole and is found according to Socrates in the man who has these same elements in friendly harmony in which the one ruling principle of reason and the two subject ones of spirit and desire are equally agreed that each ought to rule Justice—the only virtue which remains when the other virtues of temperance and courage and wisdom are absented—is the ultimate cause and condition of the existence of all of them and while remaining in them is also their preservative It is the virtue which does not permit the several elements within a man to interfere with one another or any of them to do the work of others

The political analogy finds justice in the well-ordered state where wisdom rules courage defends the laws and peace and temperance balances the economy Wisdom would belong most properly to the guardians courage to the auxiliaries while all three classes would need temperance Hegel also associates courage with the military class—that universal class which is charged with the defence of the state

and men of sanguine temperament extremely self-confident or at least free from fear would be as courageous as those who succeed in mastering their fears in order to do what is expected of them. But as Aristotle observes, drunken men often behave fearlessly and we do not praise them for their courage. Plato likewise presents a view of courage which requires fore-thought and a genuine concern for danger.

I do not call animals which have no fear of dangers, because they are ignorant of them, courageous says Aquinas in the *Lectures*. They are "only fearless and senseless." There is a difference to my way of thinking he goes on between fearlessness and courage. I am of the opinion that thoughtful courage is a quality possessed by very few but that rashness and boldness, and fearlessness, which has no fore-thought are very common qualities possessed by many men, many women, many children and many animals. According to this conception of courage "courageous actions, *Nicias* says, are wise actions."

I live with these considerations, the definition of courage would involve a reasonable or prudent discrimination between what should be feared and what should be undertaken in spite of peril or pain. As the Lanson declares, in his discourse on the Seven Deadly Sins in the *Cathedral Treasury* the virtue is so mighty and so glorious that it dares to withstand sturdily and wisely to keep itself from dangers that are wicked and to wrestle against the assaults of the Devil. For it enhances and strengthens the soul. It can endure long, suffer the torts that are fitting.

To be able to make decisions of this sort in particular cases a man must have some view of the order of goods and the end of life. For a man to act habitually in a courageous manner he must be generally disposed to value certain things as more important than others, so that he is willing to take risks and endure hardships for their sake.

Freud seems to be skeptical of what he calls the rational explanation for heroism according to which one is in the desire that the personal life is not to be so precious as certain abstract general ideals. More frequent in his opinion, that man is not a cold impulsive hero-

ism which knows no such motivation and flouts danger in the spirit of Anzengruber's Hans the Bold Mender. Nothing can happen to me But Aquinas, who emphasizes rational motivation as much as Freud discounts it, insists that courageous men face the danger on account of the good of virtue which is the abiding object of their will however great the danger be."

Courage as Aquinas conceives it though only a part of virtue in the sense of being one virtue among many nevertheless represents the whole moral life from one point of view. The quality of courage he points out "overflows into the rest of the virtues, as these in turn enter into courage. Whoever can curb his desires for the pleasures of touch, Aquinas writes, so that they keep within bounds, which is a very hard thing to do, for this very reason is more able to check his daring in dangers of death so as not to go too far which is much easier and in this sense fortitude is said to be temperate."

"Again," he continues, "temperance is said to be brave because fortitude overflows into temperance. This is true in so far as he whose soul is strengthened by fortitude against dangers of death which is a matter of very great difficulty is more able to remain firm against the onset of pleasures for as Cicero says, it would be inconsistent for a man to be unbroken by fear and yet vanquished by cupidity or that he should be conquered by it after showing himself to be inconquerable by it!"

As the man who is temperate because he has rationally ordered his actions to a certain end can be expected to be courageous for the same reason so, according to Aquinas he will also be prudent since both his temperance and his courage result from a prudent or rational choice of means to the end he pursues.

Written as a theologian Aquinas distinguishes what he calls the perfecting virtues of the religious life from "the social virtues of the political life—the virtues with which the moral philosopher is concerned. He holds courage to be inseparable from the other virtues on either plane—whether directed to a natural or supernatural end—because it is the sureness of the end in each case which binds the virtues together. Thus prudenter by contemplating the things of God, he explains, counts as nothing all the things of this world and temperance so

Aristotle originates the analysis of virtue as a mean between two vices because the vices respectively fall short of or exceed what is right in both passions and actions. It requires prudence to decide what things should be feared when they should be feared and how much and so a prudent judgment is involved in fearing the right things at the right time and in the right manner—neither too much nor too little.

The coward the rash man and the brave man Aristotle writes are concerned with the same objects but are differently disposed to them for the first two exceed and fall short, while the third holds the middle which is the right position and rash men are precipitate and wish for dangers beforehand but draw back when they are in them while brave men are keen in the moment of action but quiet before hand.

Aristotle is not the only one to define courage as a middleground between contrary extremes. Most writers who devote any attention to the nature of courage come to somewhat the same conclusion. Epictetus for example in declaring that we should combine confidence with caution in everything we do seems also to make courage a mean. He points out that such a combination at first may appear a paradox since caution seems to be contrary to confidence and contraries are by no means compatible. But this he says is only due to confusion. There would be a paradox if we really called upon a man to use caution and confidence in regard to the same things as uniting qualities which cannot be united. But as Epictetus explains caution and confidence can be united because they concern different objects.

The difference in objects which he has in mind becomes clear in the light of the Stoic maxim Be confident in all that lies beyond the will's control be cautious in all that is dependent on the will. Sharply distinguishing between what does and does not lie within our control Epictetus tells us to look with care and caution only to those things in which we can do evil by making an evil choice. In such matters of will it is right to use caution. But in other matters in things outside the will's control which do not depend on us we should use confidence.

By uniting caution and confidence we find the extremes of foolhardiness and cowards and achieve the mean in which Aristotle's courage consists. Both are necessary. Cowardice is not the only vice opposed to courage. The man who acts without caution in the face of danger recklessly disregarding what might be reasonably feared is foolhardy rather than courageous even as the coward is held back from which his reason tells him should be or done.

Because he agrees that courage consists in avoiding both extremes Spinosa writes that flight at the proper time just as well as fighting is to be reckoned as showing strength of mind. These two acts are allied since it is the same virtue of the mind that a man avoids danger and seeks to overcome it.

To determine at a given moment whether to flee or to fight so as to avoid either foolhardiness or cowardice obviously involves a course of reason. Such a decision according to Spinoza demands strength of mind by which he means the desire by which each person is drawn from the dictates of reason alone to preserve his own being. Without rational direction or as Aristotle would say without prudence one may be fearless but not courageous.

Those who like Hobbes do not include reason or prudence as an essential element in the conception of courage treat courage as an emotion rather than a virtue and tend to ride it with fearlessness making its opposite the condition of being over fearful. Amongst the passions writes Hobbes courage (by which mean the contempt of wounds and violent death) inclines men to private resentments and sometimes to endeavor the unsettling of the public peace and timorousness many times as poses to the desertion of the public itself. As Hobbes describes courage it may be of doubtful value to the individual or to the state. Melville seems to have this meaning of courage in mind when he says that the most reliable and useful courage is that which arises from the fair estimation of the encountered peril—the lack of which makes an utterly fearless man a far more dangerous companion than a coward.

If apparent fearlessness were courage certain animals might be called courageous

Pi. Isch, in his life of Lycurgus, shows how "there was a sort of calm." The training and education of all was directed to military valor. These very men had a life and spirit in them but informed and possessed men's minds with an enthusiasm and ardour for a town. The citizens always serious and moral, most usually, it was in praise of such men as had died in defence of their country or in defense of those they had been cowards, the former they declared heroes and glorified the life of the Lacedaemonians as most miserable and abject." The result was, according to Plutarch, that they were the only people in the world to whom war gave repose.

Both Plut. and Aesop's encourage the continuance of Crete and Sparta for male, war the end of the state and existing courage which is only a part above "the whole" of virtue." Courage "is joined with the other virtues to make a man good not only as a citizen but also as a man. Justice, temperance and wisdom," says the Athenian Statesman in the Laws, "when combined with courage are better than courage only."

Furthermore, military courage is not even the whole of courage. While recognizing the need for it, Plutarch thinks that a wise lawmaker will put it in its proper place if it can not be

trained to be good citizens, not merely good soldiers. Arguing that no soldier in the Lacedaemonians would sacrifice its life for the sake of war and not war for the sake of peace" the Athenian Statesman suggests that a broad concept of courage than the Cretans and Spartans seem to have would recognize its use, not only in actual warfare but in the times of peace—in the struggle to lead a good life and build a good society. "What is this?" he asks Megillus the Spartan and Cleonides the Cretan, "which makes your citizens equally brave against pleasure and pain, conquering what they can, fit to conquer and unfeared by the enemies who are most dangerous and nearest home?

Nevertheless, through the centuries the type of courage which the poets and historians celebrate has been the bravery of men who put their very lives in jeopardy for their fellow men—the courage of the citizen doing his duty or what is still more spectacular of the soldier confronting the enemy. This fact among others is one reason why many writers, from the Greeks to H. H. Willam James, have seen fit for its moral equivalent. On this point they are answered no more by those who see only degradation in war but also by the many expressions of the fact that peace can have its heroes too.

## OUTLINE OF TOPICS

1 The nature of courage	2-3
2 The uses opposed to courage—cowardice, foolhardiness	250
3 The processes—the nature of courage—fear, desire, anger, hope, despair	251
4 The relation and comparison of courage with other virtues	252
5 The consequences of courage—fame & honor, happiness, love, death, religious faith	253
6 The formation of the character of the courageous man	254
The personal and social value of courage	
1. The courage required of citizens and statesmen—the political reformulation of courage	255
2. Courage in relation to law and liberty	
3. Courage in war	256

far as nature allows neglects the needs of the body fortitude prevents the soul from being afraid of neglecting the body and rising to heavenly things and justice consists in the soul's giving a whole-hearted consent to follow the way thus proposed

WE ARE THUS brought to the second qualification upon courage which arises from its connection with prudence and through prudence with the other virtues Does it make any difference whether the end for which a man strives valiantly is itself something commendable rather than despicable? If not then the thief can have courage just as truly as the man who fears dis honor more than death the tyrant can be courageous no less and no differently than the law abiding citizen

In his advice to the prince Machiavelli seems to consider only the utility of courage Refer ring to the end which he says every man has before him namely glory and riches he points out that men proceed in various ways one with caution another with haste one by force another by skill one by patience another by its opposite and each one succeeds in reaching the goal by a different method Fortune he thinks plays a large part in their success and for that reason he holds no method certain Any method requires us to use fortune to the best advantage This demands courage and even audacity

It is better to be adventurous than cautious he writes because fortune is a woman and if you wish to keep her under it is necessary to beat and ill use her and it is seen that she allows herself to be mastered by the adven turous rather than by those who go to work more coldly She is therefore always woman like a lover of young men because they are less cautious more violent and with more audacity command her

It would appear that Machiavelli recommends courage or at least daring to those who wish to succeed in great undertakings whether the end in view is commendable or not In either case courage may improve the chances of success and it is success that counts According to their notions of courage as a virtue Plato Aristotle and Aquinas sharply disagree with this as we have already seen So do Kant and Hegel

It is the positive aspect the end and con tent Hegel writes which gives significa to the spiritedness of courageous actions Rob bers and murderers bent on crime as their adventurers pursuing ends planned to suit their own whims etc these too have spirit etc to risk their lives Because their ends are either malicious or unworthy the merit of a brigand and even the courage of a bandit do not seem to Hegel to be true forms of courage

According to Kant intelligence wit judgment and other talents of the mind to the extent they are nimed or courage resolution perse verance as qualities of temperament are undoubtedly good and desirable in many respects but these gifts of nature may also become extremely bad and mischievous if the will which is to make use of them and which therefore constitutes what is called character is not good If a good will is necessary to make courage virtuous then the behavior of a scoundrel may look courageous but it can only be a counterfeit Without the principles of a good will such things as the ability to face dangers or to bear hardships Kant thinks may become extremely bad The coolness of a villain he adds not only makes him far more dan erous but also makes him more abominable in our eyes than he would have been without it

It may still remain true that courage can take many forms according to the variety of objects which inspire fear or according to the types of action which men find burdensome or painful But if the truly courageous man must always be generally virtuous as well then most of the appearances of courage do not spring from genuine virtue The conception of virtue as a habit adds the criterion of a settled disposition even the habitual coward may perform a single courageous act Nor should courage be attributed to those who by freak of temperament are utterly fearless The merit of virtue—overcoming fear—cannot be claimed by them

*IN THE GREAT political books especially those of antiquity the place of courage in the state and in the training of citizens receives particular attention The constitutions of Crete and Sparta seem to make courage the only essential virtue for the citizen*

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad* BK II § 6, 83] 12d the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS** One or more of the main divisions of a work (such as PART BK CH. SECT) are sometimes included in the reference line numbers in brackets, are given in certain cases e.g. *Iliad* BK II [26, 28] 12d

**BIBLE REFERENCES** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows e.g. OLD TESTAMENT *Nehemiah* 7:45—(D) *II Esdras* 7:46

**SYMBOLS** The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. *passim* signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

# *Chapter 14 CUSTOM AND CONVENTION*

---

## *INTRODUCTION*

THE contrast between the artificial and the natural is generally understood in terms of the contribution which man does or does not make to the origin or character of a thing. Works of art are man made. The artificial is somehow humanly caused or contrived. The contrast between the natural and the conventional or customary involves the same point of difference. Though customs are not in the strict sense *made* by man as are works of art, they do grow only as the result of the kind of acts which men perform voluntarily rather than instinctively. Similarly conventions like contracts are social arrangements or agreements into which men enter voluntarily.

The fundamental notions with which this chapter deals are thus seen to be closely related to ideas and distinctions treated in the chapters on ART and NATURE. For example the distinction between human action and production or doing and making helps us to understand how the conventional and the artificial differ from one another as opposites of the natural. Art involves voluntary making. Customs result from voluntary doing. In both cases the distinction between the voluntary and the instinctive—the latter representing the natural—seems to be presupposed.

A third term—habit—is traditionally associated with the consideration of the voluntary and the instinctive. Like these others it seems to have a critical bearing on the discussion of custom and art. Aristotle for example conceives art as an intellectual virtue that is a habit of mind an acquired skill. For Hume the customary and the habitual are almost the same. Whether they are to be identified or are only connected causally the relation of habit to custom not only throws some light on the nature of custom but also calls our attention to the fact that the words custom

and convention cannot be treated simply as synonyms.

In the tradition of the great books the word convention has at least two meanings, of which only one of which is it synonymous with custom. When convention is used to signify habitual social practices it is for the most part interchangeable with custom. In this sense the notion of convention like that of custom is an extension of the idea of habit. What habit is in the behavior of the individual, custom or conventional conduct is in the behavior of the social group.

The other meaning of "convention" does not connote the habitual in social behavior but stresses rather the voluntary as opposed to the instinctive origin of social institutions arrangements or practices. For example different sorts of family organization are conventional in the sense that at different times or in different communities men have set up their domestic arrangements in different ways. In each case they tend to perpetuate the particular institution which they or their ancestors originated. Whatever is conventional about social institutions might have been otherwise if men had seen fit to invent and adopt different schemes for the organization of their social life. This indicates the connection between the two senses of the word convention for all customs are conventional in origin and all conventions become customary when perpetuated.

THE FACT THAT men can depart from as well as abide by their conventions—that they can transgress as well as conform to custom—seems to indicate that custom and convention belong to the sphere of human freedom. Yet there is also a sense in which custom is a constraint force which reduces the tendency of individuals to differ from one another and which hinders

effect of moulding them alike and regaining their lives.

The repressive effect of custom can be seen and no Freud in the neurotic disorders in which men suffer when their instinctive pulses come into conflict with accepted customs.

Discussing the influence of custom upon developing individual he says that its influences frequently too stringent exact a great toll from him much self restraint much renunciation of instinctual gratification. It becomes therefore one of the aims of psychoanalytic therapy to release the individual from bondage to custom or at least to make him conscious of the way in which certain desires have been submerged or distorted and his sole personality shaped by the constraints such the mores and taboos of the tribe have imposed upon him.

Considered in relation to society custom also tends to exercise a conservative if not repressive effect. Established customs tend to resist change. They are sometimes thought to impede progress. But to the extent that they conserve the achievements of the past they may be indispensable to progress because they provide the substance of what we call tradition. A passage in Bacon's *Advancement of Learning* illustrates these apparently contrary effects of custom.

Over-emphasis upon either antiquity or novelty seems to Bacon a disease of learning or an obstacle to its advancement. Antiquity entitles there should be new additions, he writes and novelty cannot be content to add but it must deface. If custom tends to support antiquity against novelty it may also encourage innovations or discoveries which genuinely enhance the tradition without defacing it. An antiquity deserveth that reverence Bacon says, that men should make a stand thereupon and recover what is the best way but when the recovery is well taken then to make progression. As the preserve of antiquity custom bus appears to afford a basis for progress.

One other fact about customs which most commentators from Herodotus to Montaigne and Freud have observed their variety and variability. Customs differ from time to time and from place to place. But this diversity and variation in custom does not necessarily mean

that no uniformity at all exists in the actions of men. Were there no uniformity in human actions Hume points out it would be impossible to collect any general observations concerning mankind. At least enough uniformity is found in his opinion for it to be universally acknowledged that human nature remains still the same. To whatever extent human behavior is purely natural or instinctive it is common to all members of the species and does not like customary conduct vary remarkably from one part of the human race to another or from generation to generation.

The diversity and variation of customs seems therefore to be of their essence and to show that they are both man made and voluntary in origin. If they were not devices of men Auguste writes, they would not be different in different nations and could not be changed among particular nations. The distinction between nature and convention can be formulated therefore, partly in terms of the contrast between the constant and the variable and partly in terms of the difference between the instinctive and the voluntary.

The early Greeks had an apt way of expressing this. As Aristotle phrases their insight they referred to the natural as that which everywhere has the same force and does not exist by people's thinking this or that as, for example "fire burns both here and in Persia. The conventional and those things which are not by nature but by human enactment are not everywhere the same. The laws of Persia differ from the laws of Greece and in Greece or in Persia they change from time to time.

THE VARIABILITY of custom in contrast to the constancy or uniformity of nature puts the distinction between nature and convention at the service of the skeptic. One form of the skeptical attack upon natural law universal moral standards, and the objectivity of truth or beauty consists in making custom the only measure of the acceptability of human actions or judgments. To say for example as Hume does that the connection which the mind seems to make between cause and effect is based on custom rather than reason has the skeptical effect which Hume intends. It substitutes the arbitrary for the rational. It dispossesses reason as a source of

either the validity or the intelligibility of our conclusions concerning cause and effect

As the chapters on KNOWLEDGE and OPINION indicate the skeptical argument takes other forms. The reduction of all human judgments to opinion makes the differences between men in either action or thought unresolvable by argument or debate. One opinion can predominate over another only by force or by the weight of numbers. When it predominates by weight of numbers it prevails by custom or convention. It is the opinion which the majority have agreed upon at a given time or place. To settle every controversy about what men should think or do by counting heads is to hold that everything is a matter of opinion and purely conventional.

Whether the skeptic reduces everything to opinion or to convention he achieves the same effect. What he means by calling everything an opinion or a convention is equally inimical to reason. In either case the willful or arbitrary is enthroned in reason's place and only force can be finally decisive. The two ideas—opinion and convention—seem to be corollaries of one another. Both imply a kind of relativity. Opinion normally suggests relativity to the individual custom or convention relativity to the social group. Either may be involved in the origin of the other. The individual may form his opinions under the pressure of prevailing customs of thought or action; the customary beliefs or practices of a society or culture may and usually do result from opinions which have come to prevail.

The Greek sophists we learn from the dialogues of Plato appealed to the distinction between nature and convention and to the distinction between knowledge and opinion in exactly the same way. They used the notions of opinion and convention with equal force in their efforts to question absolute standards of conduct and the objectivity or universality of truth. The most familiar of all the sophistical sayings—the remark attributed to Protagoras that man is the measure of all things—is interpreted by both Plato and Aristotle to mean that what men wish to think or do determines for them what is true or right. Man's will governs his reason and convention or the agreement of individual wills decides what is acceptable to the group.

In the *Gorgias* which is named after another of the leading sophists of the day, Pluto gets into the mouth of Callicles the sophistic position that there is no law or standard of justice except the rule of the stronger. Insisting that convention and nature are generally at variance with one another, Callicles attempts to show that all of Socrates' efforts to discover an absolute standard of justice come to naught because he cannot help but resort to the popular and vulgar notions of right which are not natural but conventional.

As they appear in Plato's dialogues the sophists are obviously impressed by the kind of formation which fills the *History of Herodotus*—information about the great diversity of man beliefs and practices which anyone could discover for himself if he traveled as Herodotus did from people to people observing their institutions and collecting their legends. Herodotus himself does not explicitly draw the skeptical conclusion yet his own suspended judgment on many matters betokens a turn of mind made cautious by the impact of contrary opinions and conflicting customs.

In the Hellenistic period when the mass of Greek philosophy divides into a number of Roman schools of thought the skeptical position receives what is perhaps its fullest and most explicit statement. But in the writings of Lucian and Pyrrho to take two examples it is not so much the conflict of customs as it is what Lucian calls the warfare of creeds which occasions universal doubt. Yet whatever the source of doubt Pyrrhonism states the traditional denials of the skeptic in their most extreme form. The senses are entirely unworthy. Reason is both impotent and self-deceiving. Men possess no knowledge or science. No truth is self evident none can be demonstrated.

THE CRITICAL TEMPER of the Greek sophists and of an observer of men and manners like Herodotus reappears later in the questions of Montaigne—sharpened somewhat perhaps by his acquaintance with the Roman skeptics. In his case perhaps more than any other we see the implications of custom which everywhere expatiated on in his *Essays* give them the skeptical tone. Not himself a traveler in distant

is Montaigne traverses the world of time and space by reading. He becomes conversant with the strange customs of the aborigines and the Orient through the reports of returned travelers. He cull from the historians and geographers of antiquity every difference in custom which their books set forth as fact or fable. Montaigne's insatiable appetite for collecting and comparing customs is not an aimless fascination; on his part with the spectacle of human variety. It steadfastly leads him to the conclusion which is for him the only one possible. Since every belief or practice can be paired with its opposite in the customs of some other time or place no belief or practice can demand unqualified or universal assent. There is nothing he writes which custom does not or may not do and therefore with every good reason it is that Sndar calls for the ruler of the world.

To say as Montaigne does that the taste for good and evil depends in good part upon the opinion we have of them and that everyone is well or ill at ease according as he so finds himself amounts to saying that all moral judgments are matters of opinion, either individual or customary in origin. Beauty too is a matter of taste. We fancy its forms. Montaigne's books, according to our own appetite and liking. As may be seen in the chapter on BEAUTY, Montaigne assembles an abundance of evidence to show that standards of beauty vary with different peoples. The tastes or preferences of one group are as unaccountable as they are frequently revolting to another.

Even in the field of speculative thought about the nature of things, Montaigne regards the thing itself to be true as nothing more than personal opinion—the cultural conventions of a time or place. We have no other idea of truth and reason than the empirical idea of the opinions and customs of the place wherein we live. There is always the perfect religion that is the most perfect government there the most exact and accomplished usage of all things.

Of all human deceptions or impostures none is worse than that which flows from a man's unwillingness to qualify every remark with the admission that this is the way it seems to me. In the last place there is no greater folly in the world than the failure to recognize that

we reduce truth and falsity to the measure of our capacity and the bounds of our sufficiency. When new ideas or the strange beliefs of others at first seem incredible simply because they are not our own we shall find that it is rather custom than knowledge that takes away their strangeness. For his own part Montaigne makes his emblem the question What do I know? This he says sums up his Pythagorean philosophy.

According to the modern social scientist who claims that custom is the ultimate standard of conduct and that it provides the only criterion of moral judgment no questions can be raised about the goodness or evil of particular customs. The customs of one people cannot be judged by another at least not objectively or impartially for those who judge must do so on the basis of their own customs. Since there is no arbiter above conflicting customs to say which is right, a particular custom has validity only for the group in which it prevails. Within that social group the character of conduct of its individual members is measured by conformity to the prevailing customs.

The descriptive science of sociology or comparative ethnology thus tends to replace the normative science of ethics—or moral philosophy. The only scientifically answerable questions about human conduct take the form of How do men behave? or How have they acted individually or in groups? but not How should they? The study of morality as in Sumner's *Folkways* becomes a study of the mores—how the customs which measure conduct develop and dominate or as in the writings of Freud it becomes a study of how the individual is psychologically formed or deformed by the mores of his tribe and culture according to the way in which the growing child reacts to the pressures which the community imposes through parental discipline.

With these views many philosophers and theologians both ancient and modern take issue. But their opposing doctrine seldom goes so far as to deny that morality has certain conventional aspects. In arguing that there are no absolute practical principles Locke for example like Montaigne cites instances of contradictory customs to show that there is scarce that principle of morality to be named or rule of virtue

to be thought on which is not somewhere or other slighted and condemned by the general fashion of whole societies of men governed by practical opinions and rules of living quite opposite to others

But Locke does not leave this observation of the diversity of customs unqualified. He goes on to assert that though perhaps by the different temper education fashion maxims of interest of different sorts of men it fell out that what was thought praiseworthy in one place escaped not censure in another and so in different societies virtues and vices were changed yet as to the man they for the most part kept the same everywhere. For since nothing can be more natural than to encourage with esteem and reputation that wherein every one finds his advantage and to blame and discountenance the contrary it is no wonder that esteem and discredit virtue and vice should in a great measure everywhere correspond with the unchangeable rule of right and wrong which the law of God hath established. Even in the corruption of manners the true boundaries of the law of nature which ought to be the rule of virtue and vice were pretty well preferred.

For Locke then as for many others there appear to be underlying the variety of customs moral principles of universal validity that draw their truth from the nature of man which represents a constant and common factor throughout the diversity of cultures. Accordingly it would seem to follow that just as habits are modifications of instinct or developments of the individual's native capacities for action so customs are conventional elaborations of what is natural to man as a social animal. On this theory the conventional cannot be understood except by reference to the natural i.e. the nature of man or society.

The view that conventions have a natural basis is most readily exemplified by Aristotle's theory of natural and legal (or conventional) justice and by the teaching of Aquinas concerning natural and positive law. For the Greeks the legal and the conventional are almost identical so that it is a kind of justice rather than a kind of law which Aristotle calls natural. Roman philosophers like Cicero and Roman jurists like Gaius and Ulpian make what seems to be an

equivalent distinction in terms of law rather than justice. In his analysis Aquinas follows the in not the Greek vocabulary.

The Roman system of jurisprudence Gibbs tells us distinguished between those laws that are positive institutions and those which reason prescribes the laws of nature and no law. The former are man made—the result of custom and prejudice. This holds true of both written and unwritten laws, although only the unwritten precepts are now usually called customary laws. These customary laws are positive in the sense that they are humanly instituted enacted—posited by the will of the legislator rather than merely discovered by the reason of the philosopher. They are conventional in the sense that they represent some voluntary agreement on the part of the members of the community they govern whether that consists in obeying the edicts of the emperor or in giving consent to the enactments of the senate.

So far as it is conventional the law of one community differs from another and with the history of a single community the positive law changes from time to time. But such bodies of law however modified by accident or use or the Roman jurists Gibbon says concerned a drawn from the rule of right. The fact that reason prescribes this rule was their explanation of certain common elements which albeities of positive law seem to contain.

The principles underlying all codes of law whether discovered directly by reason or drawn inductively as Grotius later suggests from the comparative study of diverse legal systems comprise the precepts of what the Romans and later Aquinas call natural law. Thus these writers seem to re affirm though somewhat different language Aristotle's position that what is naturally just is the same for all men everywhere and always while the laws of Greece and Persia represent diverse conventional determinations of the universal principles of justice.

The theory of natural right and natural law as expressed in the writings of Hobbes, Leibnitz and Kant as well as in the ancient and medieval tradition is of course more fully treated in the chapters on Justice and Law. But one example of the distinction between natural and conventional justice may be instructive here.

Aquinas conceives positive rules as determinations of rather than deductions from natural law. He treats such precepts as "Thou shall not kill" and "Thou shall not steal" as exclusions that reason can draw deductively from the first principle of natural law which is naturally stated in the form of the command "good harm no one and render to each his own" because these precepts are the prescriptions of reason rather than enactments of the state; they can be interpreted as declaring that murder and robbery are always and everywhere unjust. But what sort of killing and taking of what is not one's own shall be defined as murder and theft? and how offenders shall be tried, judged, and punished—these are matters which natural justice or the precepts of natural law leave open for determination by the positive laws of each community according to its own constitution and local customs.

The theory thus exemplified of the relation between conventional and natural justice or between positive and natural law applies to moral rules and ethical standards generally. For the same reason that a positive law which violates natural justice cannot be called just even though it is harmonious with the customs of the community so no rule of conduct however much it represents prevailing custom can be approved a morally right if it violates the right reason sees fit. The defenders of natural law law is also sometimes called the law of reason proclaim the existence of an absolute standard above the diversity and conflict of customs by which their soundness is measured.

Conflicting ethical doctrines raise many issues concerning what it is right for men to do or good for them to seek but the moralists at least agree that morality based on reason or nature. For them the facts of human nature or the intuitions of reason will ultimately decide the point in issue. However far apart Plato and Aristotle, Aquinas and Hegel, Kant and Mill may be in their conceptions or analyses of the right and the good they tend together at least to agree on the question of how their rules can be resolved, not by appealing to the more f the tribe or by looking to the customs of the community as a measure of by letting the customs of the majority decide.

The deepest of all moral issues therefore exists between those who think that morality somehow derives from nature or reason and those who like the ancient sophists or Montaigne or Freud find its source in custom and convention. According to the side a man takes on this issue he does or does not believe it possible to discover standards independent of custom thereby to judge whether customs are good bad or indifferent. On one belief public manners are conventional determinations of moral principles or they are sometimes violations of them just as positive laws are either determinations or violations of natural law. On the other belief the individual may be approved or condemned for conforming to or transgressing the manners or mores of his group but those manners or mores, whether they are liked or disliked by the individual are above any tenable, objective criticism.

The controversy in just prudence and morality between the naturalists or rationalists who appeal to man's nature or reason, and the positivists who hold that human customs cannot be appealed from, parallels a controversy in the theory of knowledge or science. The parallel is sue considered at greater length in the chapters on HYPOTHESIS and PRINCIPLE, can be stated by the question on whether the foundation of science—even of such sciences as logic and mathematics—consists of postulates or axioms.

Axioms, like the precepts of natural law, are supposed to have a universality denied from the nature of human reason. They are self-evident truths, compelling assent. Postulates on the contrary are like rules of positive law—voluntarily accepted assumptions which when agreed upon by the experts in a certain science become its conventional basis. In science as in law the positivists recognize nothing beyond the agreement of men to determine what shall be taken for granted as true or just.

THE DIFFERENCE between nature and convention also enters into the traditional discussion of two of the most characteristic activities of man speech and political association.

No one disputes whether the faculty of speech is natural to man. It is as natural for man to speak as for dogs to bark or birds to sing. But the question is whether any human language

having a certain vocabulary and syntax is natural or conventional. The answer seems to be dictated at once by the facts of the matter.

Human languages exist or have existed in great number and diversity, and those which still endure have gradually developed and are undoubtedly subject to further change. Hence according to the traditional understanding of the natural and the conventional these various tongues must represent conventional languages—originally invented by this human group or that perpetuated by custom altered by the conventions of usage. In contrast the expressive sounds instinctively made by other animals show themselves to be natural by the fact that they are common to all members of a species and do not change as long as the species endures.

Nevertheless as the chapter on LANGUAGE indicates the writers of the great books consider the hypothesis of a natural human language. The Old Testament story of the Tower of Babel is sometimes interpreted as implying the existence of one language for all men before God confounded their speech and diversified their tongues. The story of Adam's giving names to the various species of plants and animals in the Garden of Eden is also cited by those who think there can be natural as well as conventional signs. In Plato's *Cratylus* the attempt is made to discover the natural names for things, or at least to discern some natural basis for the words of a conventional language like Greek.

These who reject the hypothesis of a single human language from which all others have developed by diversification or who regard a purely natural language as impossible in the very nature of the case sometimes acknowledge the possibility of certain common elements—principles of syntax if not words—present in all human languages. The discovery of the common rules of speech was the object of the speculative grammarians in the Middle Ages and of those who like Arnauld and others later tried to formulate a universal grammar. On their view all languages even if they are conventional as written or spoken may have the same natural basis in the fact that they are all used to express what men can naturally perceive or think.

As in the case of language so in the case of so-

cieties the question is whether the family and the state are wholly natural, wholly conventional or partly one and partly the other—the institutions being erected by choice and built upon a natural basis. And as in the case of language here too the great books do not for the most part give either of the extreme views. They do not say that the state is entirely natural that it is the expression of human nature as the bee hive and the ant mound are instinctive formations. Nor do they say that it is completely conventional that it comes into existence only as the result of voluntary association on the part of men contracting together in a political community.

While Aristotle says that man is by nature a political animal and that the state is therefore a creation of nature he also distinguishes between the ways in which men and other animals are gregarious. Unlike the association of animals which he attributes to instinct the society of men rests on reason and speech. Man is the only animal he writes endowed with the gift of speech intended to set forth the expedient and the inexpedient and therefore likewise the just and the unjust. Because these things cities differ from one another bee hives or ant mounds do not.

The diversity of states represents for Aristotle a deliberate inventiveness on the part of man and an exercise of free choice—certainly so far as states are politically constituted each in its own constitution. Aristotle's remark that while a social impulse is implanted in all men by nature yet he who first founded the state was the greatest of benefactors may look like contradiction but its two parts can be read quite consistent with one another if the first taken as signifying the natural basis of the state (in a social impulse) and the second as saying that a certain convention (a constitution) is required to shape that impulse before any state is actually established.

As Aristotle is sometimes interpreted to hold the theory that the state is entirely natural so Hobbes, Locke and Rousseau are often read as maintaining the opposite extreme—it is entirely conventional. The extreme interpretation is based on the sharpness with which each of them distinguishes between men in a state of nature and in a state of civil society.

ough they differ among themselves in their position of these two conditions of man they m to agree that for men to pass from a state nature whether hypothetical or historical in such men lie in anarchy or at least in isolat in it is necessary for them to enter into a tract or compact with one another Since is social contract is the original or origin g convention by which the common alth or civil society is established it would em to follow that on their view the state is surely a product of convention and in no ay natural

Yet Hobbes Locke and Rousseau each in his own way add a qualification in favor of the naturalness of the state just as Aristotle qualifies is remark that the state is a creation of na ure by praising the man who first founded the state. The exponents of the social contract theory of the state's origin find in the nature of man or in his reason an instinct a need or a law which impels or bids him to seek association with others for the sake of advantages which he cannot enjoy apart from civil society. This suffices to affirm the existence of a natural basis for the convention or contract which establishes the state.

These apparently opposed theories of what is natural and what conventional about the state bus appear to approach each other though one starts from an emphasis on the state's natural ness the other from its conventional origin. The hole problem is of course further treated in the chapters on FAMILY and STATE but one point which the foregoing discussion suggests receives special consideration in still another chapter. The point concerns the relation between the idea of a constitution and the idea of a social contract. Both are conceived as the basic or primary convention which establishes the state. The question on whether the two ideas are interchangeable or only analogous is examined in the chapter on CONSTITUTION.

CUSTOM IS BOTH a cause and an effect of habit. The habit of the individual certainly reflects the custom of the community in which he lives and in turn the living customs of any social group get their vitality from the habits of its members. A custom which does not command general compliance is as dead as a language no

longer spoken or a law no longer observed. This general compliance consists in nothing more than a certain conformity among the habits of individuals.

The continuity between custom and statute as parts or phases of the positive law rests upon the relation of both to habit. Custom according to Aquinas has the force of a law abolishes law and is the interpreter of law precisely because it operates through the habits of the people. By repeated external actions such as produce a custom the inward movement of the will and the conceptions of the reason are most revealingly declared and according to Aquinas all law proceeds from the reason and will of the lawgiver. The law which a prince or a people enacts to become effective as social regulation must develop a particular habit of conduct in many individuals. Then and only then does a new enactment obtain the full force of law. To remain effective it must continue to have the support of the customs of the country.

Without that support it may be a law on the books but not in practice for the authority of a law cannot long prevail against a contrary custom except through a degree of coercion so oppressive as to produce rebellion. That is also why the customary or unwritten rule—usually the primitive form of positive law—is less flexible less amenable to change or modification. Custom is a conservative factor. There is nothing more difficult to take in hand writes Machiavelli nothing more perilous to conduct or more uncertain in its success than to take the lead in the introduction of a new order of things. The innovator has for enemies all those who have done well under the old conditions and like arm defenders in those who may do well under the new.

Just as custom may either support the written law or render it ineffective so custom works in opposite directions as a social force. It is both a factor of cohesion and of division among men—a cause of what is called social solidarity and a barrier separating peoples from one another. When the Athenians refuse to ally themselves with the Persians they chide the Spartans according to Herodotus for fearing that they "might make terms with the barbarian." For all the gold on earth they tell the Spartan

enross they could not take part with the Medes To do so would betray our common brotherhood with the Greeks our common language the altars and sacrifices of which we all partake, and the common character which we bear'

The barbarians or the gentiles—to use the traditional names for aliens or foreigners— are excluded by a social not a geographic boundary line the line drawn between those who share a set of customs and all outsiders. When the stranger is assimilated the group does not adopt him he adopts the customs of the community. The very word *community* implies a multitude having much in common More important than the land they occupy are the customs they share

The Federalists advocating the political union of the thirteen American states, could urge feasibility on the ground that a social union already existed Providence has been pleased to give this one connected country Jay wrote to one united people—a people descended from the same ancestors speaking the same language professing the same religion attached to the same principles of government very similar in their manners and customs

Those who today advocate world federal union cannot similarly point to a world society already in existence They can only hope that if the separate states were to unite politically the social cohesion of the world's people will subsequently develop as a result of the force of universal customs by universal law

## OUTLINE OF TOPICS

- 1 The distinction between nature and convention its application to the origin of the state and of language
- 2 The origin development and transmission of customs
- 3 The conflict of customs their variation from place to place
- 4 The change of customs their variation from time to time
- 5 Custom and convention in the moral order
  - 5a The conventional determination of moral judgments the moral evaluation of conventions
  - 5b The effect of custom on the training and character of men
- 6 Custom in relation to law
  - 6a Constitutions social contracts positive laws and manners as conventions
  - 6b The force of custom with respect to law
- 7 Custom in social life
  - 7a Custom as unifying a community
  - 7b Custom as a barrier between communities
  - 7c Custom as determining economic needs or standards
  - 7d The influence of custom on the liberty of the individual
- 8 Custom in relation to order and progress the factors of tradition and invention
- 9 The bearing of custom on thought
  - 9a Custom as a source of opinion and belief its influence on judgments of beauty
  - 9b The conventionality of truth postulation choice among hypotheses

## REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 Horace *llad.* BK II [6, 283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of part 12.

**P or S CITATIONS.** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 33 *J. Scts. P. Philology* 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 *PLATO Symposium* 163b-164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**ACTORS.** DIVISIONS. One or more of the main divisions of a work (such as ACT, BK, CH, & CT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g. *llad.* BK II [65] 12d.

**BIBLIOGRAPHIES.** The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows, e.g. Old Test. MATT. 1:4-10 (D) II Esdras, 1:4.

**TOPICS.** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference; passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style for general guidance in the use of *The Greek*; consult the Preface.

## *Chapter 15 DEFINITION*

### INTRODUCTION

DEFINITION has been variously defined in the tradition of the great books. These diverse conceptions of what a definition is raise many issues.

At one extreme writers like Hobbes look upon definition as nothing more than an attempt to say what a word means—how it has been or is being used. At the other writers like Aquinas regard definition as that act of the mind by which it expresses the nature of a thing or formulates its essence.

In one technical view associated with the name of Aristotle to define is to state the genus and differentia by which the species of a thing is constituted. In another theory of definition advanced by Locke and others any combination of traits which distinguishes one class or kind of thing from another defines the character common to all members of that class. In still another view to be found in Spinoza definition consists in giving the cause or genesis of a thing in saying how the thing originated or was produced.

Sometimes definition through causes employs the final rather than the efficient or productive cause and characterizes the thing by the end it naturally serves. And sometimes as with William James definitions simply express the purposes or interests which we have in mind when we classify things to suit ourselves.

In the tradition of the liberal arts of grammar, rhetoric and logic these various conceptions of definition are connected with controversies concerning the power and activity of the human mind, the relation of language to thought, the structure of science or more generally the nature of knowledge, and the constitution of reality with particular reference to the existence of universals and individuals and their relation to one another.

These connections appear in the thought of

Aristotle and Spinoza, Hobbes and Locke, Aquinas and William James. Their views of the matter in which definitions should be constructed and their conceptions of the function of definitions determine and reflect lines of agreement and opposition on many other matters. The use of definitions in the great works of mathematics and natural science—by Euclid, Descartes, Galileo, Newton, Lavoisier and Darwin—tends to exemplify now one, now another, theory of definition. Modern discussions of the nature of science and mathematics especially, discussions influenced by the development of mathematical logic—from Whewell, Mill, and Poincaré to Whitehead, Russell and Dewey—focus critical attention on the nature and use of definitions.

MANY OTHER chapters provide an illuminating context for topics discussed in this one especially the chapters on LANGUAGE and LOGIC, IDEA PRINCIPLE and REASONING, PHILOSOPHY and SCIENCE and TRUTH. Though the issues concerning definition cannot be resolved apart from this larger context of controversy about the mind, reality, and knowledge we can nevertheless formulate these issues in isolation. But in doing so we ought to bear in mind that they can be more readily understood in proportion as they are seen in the light of other relevant considerations.

There is first of all the question about the object of definition. What is being defined when men make or defend definitions? This question broadens into the problem of nominal as opposed to real definitions. That is a complex problem which raises a number of further questions. Are all definitions arbitrary expressions of the conventions of our speech or the particular purpose we have in mind when we classify things? Or do some if not all definitions es-

ress the real natures of the things defined? Do they classify things according to natural kinds which have reality apart from our mind and its interests?

These issues are in turn related to the issue concerning the limits of definition and its ultimate principles—whether all things, or only one, are definable and whether the indefinable terms without which definition is itself “possible” can be arbitrarily chosen or must always be terms of a certain sort. The sense in which definitions may be true or false and the use in which they cannot be either have a bearing on all these issues and through them upon the divergent conceptions of how definitions can or should be constructed.

Later in the course of argument one man discusses the opinion of another by saying: That is just a matter of definition; the usual implication is that the rejected opinion has no truth apart from the way in which the man who proposed it uses words. He may even be accused of begging the question, of framing definitions which implicitly contain the conclusion he subsequently draws from them.

The underlying supposition here seems to be expressed by Pascal when in his essay *On Geometrical Demonstration* he asserts that there is great freedom of definition and definitions are never subject to contradiction for nothing is more permissible than to give whatever name we please to a thing we have clearly pointed out. He calls true definitions those which are arbitrary, permissible and geometrical. The only restriction he would place upon our freedom to make definitions is that we must be careful not to take advantage of our freedom to impose names by giving the same name to two different things. And even this case he claims, is permissible if we avoid confusion by not extending the consequences of one to the other.

If we are free to make whatever definitions we please, it would seem to follow that definitions cannot be matters of argument and differences of opinion which result from differences in definition would seem to be irreconcilable by any appeal to reason or to fact.

Such a conception of definition as this does not seem to prevent Hobbes from holding

that definitions are first principles or foundations of science. In Geometry (which is the only science that it hath pleased God hitherto to bestow on mankind) men begin he writes at settling the signification of their words which settling of significations, they call Definitions and place them in the beginning of their reckoning. This shows, Hobbes thinks, how necessary it is for any man that aspires to true knowledge to examine the definitions of former authors and either to correct them where they are negligently set down, or to make them himself. For the errors of definitions multiply themselves, according as the reckoning proceeds.

For Hobbes, then, definition is verbal yet definitions can also be true or false and on the truth of definitions depends the distinction between knowledge and opinion. “In the right definition of names,” he says, lies the first use of speech which is the acquisition of science. Only when discourse begins with the definitions of words can it reach conclusions that have the character of knowledge. If the first ground of such discourse be not definitions then the end or conclusion is opinion.

Hobbes accurately reports the nature of geometry when he says that in that science definitions serve as principles in reasoning or proof. The words *by definition* mark one of the steps in many Euclidean proofs. Descartes and Spinoza proceeding in the geometrical manner place definitions at the head of their works as ultimate principles to be used in validating their conclusions. But unlike Hobbes, these writers do not seem to regard their definitions as merely verbal. Euclid goes further as we shall presently see and offers what amounts to proofs of his definitions, or at least of their geometrical reality. Aristotle and Aquinas certainly take the position not only that definitions are principles, but also that definitions themselves are capable of being demonstrated. But they complicate the matter by insisting that definitions are neither true nor false since as Aristotle says they do not involve “the assertion of something concerning something.”

At least two questions seem to be involved in this familiar dispute about the argutability of definitions and their role in argumentation. To avoid confusion, they should be kept distinct. One is the question of the truth and falsity of

definitions It should be separated from even though it is related to the other question about whether all definitions are nominal *i.e.* concerned only with assigning meanings to the words by which we name things To understand what is involved in this second question it may be helpful to consider the relation of words thoughts and things in the process of definition

A DICTIONARY is supposed to contain definitions It does in part—insofar as the meaning of any word is expressed in a phrase containing other words which are not synonyms for the word in question The combined meanings of these other words determine the meaning of the word being defined

For example one definition of the word brother is a male relative the son of the same parents or parent Another is a male member of a religious order These two definitions give different meanings for the same word The dictionary is here recording two ways in which as a matter of historical fact the word has been used It has been and can be used in still other ways No one of these definitions can be called right and the others wrong

Dictionary definitions seem to be verbal and arbitrary in a number of ways That the word brother should carry any of the meanings which the dictionary records is an accident of English usage It is arbitrary that that particular sound or mark should be the name for a male relative who is the son of the same parents It would be equally arbitrary to restrict the meaning of the word brother to any one of its definitions

Nothing about a word limits the number of distinct meanings with which it can be used As Locke says every man has so inviolable a liberty to make words stand for what ideas he pleases that no one hath the power to make others have the same ideas in their minds that he has when they use the same words that he does A word is thus a conventional sound or mark which can be given any meaning convention assigns to it When that meaning is expressed in other words we have a verbal definition and such definitions are certainly nominal in this sense—that they state the meaning of a name

But are they merely nominal? Are they entirely arbitrary? That this word should be used to name this thing is arbitrary but that we it is so used a certain definition also applies may not be arbitrary Among the several verbal definitions of a word the one which applies in any particular case will depend upon the character of the thing which the word is used to name

For example if John and James are sons of the same parents the name brother applies but not with the same definition which is required for the application of the name to Mark and Matthew who are unrelated by blood as members of the same monastic order When the word brother is used to mean may be arbitrary but when it is used now of John and James and now of Mark and Matthew it would be misapplied if it did not carry the appropriate definition Which definition is appropriate in each case does not seem to be arbitrary since that appropriateness depends not on our will but on the objective facts of the case—the actual relation of the persons called brothers

Precisely because the word is used to name a thing the definition of the word as so used does more than state the meaning of the word It states something about the character of the thing named Definitions remain merely verbal only so long as the words they define are not actually used to name or to signify things in some way Whenever a thing is named or signified the definition which gives the meaning of the word must also signify something about the nature of the thing

In the natural order of ideas writes Leibniz the name of the class or genus is that which expresses a quality common to a great number of individuals the name of the species on the contrary expresses a quality peculiar to certain individuals only These distinctions are not as some may imagine merely metaphysical but are established by Nature

YET IT MAY BE said that the definition is still nominal for it depends entirely on the meanings of the words which express it For example one definition of brother involves the meanings of such words as male and relative son parents and same If we were to

ok these words up in a dictionary the definitions we found would involve the meanings of still other words, and so on in an endlessly circular fashion. Furthermore we would find no account of certain words such as relative and same somewhat unsatisfactory as definitions because the meaning of the defining words could indeedately involve the meaning of the word to be defined. To say that "same means not other or not different" seems the same as saying same means same. Yet we must know the meaning of same for otherwise we could not understand the meaning of brothers" (the definition of which the word same" appears).

That some words seem to have indefinable meanings suggests that not all meanings are purely verbal or nominal and that the meaning of every word cannot be found in the meanings of other words. In the Preface to his dictionary Dr Johnson observes that "as nothing can be proved but by supposing something in itself known and evident without proof, so nothing can be defined but by the use of words so plain as to admit of definition. The circularity of the dictionary is thus avoided. When we trace meanings from one word to another we finally come to words whose meanings we seem to understand immediately or at least without reference to the meanings of other words.

Just as the arbitrary character of verbal definitions seems to be removed by the consideration of the things which words name or signify so the purely nominal character of definitions seem to be removed by recourse to meanings which are understood without further verbal explanation—meanings which may in fact be incapable of such explanation.

MOST WRITERS agree with Dr Johnson. All of them would admit that some words must be left undefined in order to define others, but which shall be used as indefinable and which shall be defined is, in the opinion of some a matter of choice. It is not so thin which can be determined by the order intrinsic to our ideas of meaning. The issue between the mathematical logicians who think that we are free to choose our primitive or indefinable terms, and those who like Aquinas think that certain terms, such as being, same, one and rela-

tions impose themselves upon our minds as principles, leaving us no choice parallels the issue between the view that the principles of a science consist of postulates voluntarily assumed and the view that they are axiomatic or unavoidable.

Far from regarding such basic indefinable terms as clearest and most indisputable in meaning Spinoza thinks that these terms signify ideas in the highest degree confused. For him the true definition of any one thing expresses nothing but the nature of the thing defined. But to arrive at the true definition it is necessary to discover the cause of the thing. For every existing thing he writes, there is some certain cause by reason of which it exists. This cause must either be contained in the nature itself and definition of the existing thing or it must exist outside the thing. In the latter case the definition of the thing always involves a statement of the external cause of its existence.

Accordingly Spinoza rejects the traditional type of Aristotelian definition as purely subjective—a matter of individual memory and imagination. Those who have more frequently looked with admiration upon the stature of men he writes, by the name man will understand an animal of erect stature while those who have been in the habit of fixing their thoughts on something else will form another common image of men describing man for instance as an animal capable of laughter a biped without feathers, a rational animal and so on each person forming universal images of things according to the temperament of his own body.

However the issue between Spinoza and Aristotle is resolved both seem to agree that more is involved in the process of definition than the statement of verbal equivalences. We have a definition Aristotle says not where we have a word and formula identical in meaning (for in that case all formulae or sets of words could be definitions). The formula which is expressed in a phrase or combination of words must state the nature or essence of a thing not just the meaning of a word. The formula in which the term itself is not present but its meaning is expressed this, according to Aristotle is the formula of the essence of each thing and he

adds there is an essence only of those things whose formula is a definition

Even supposing the truth of these statements which Hobbes or Locke certainly would question the problem of real as opposed to nominal definition requires further examination To explore the matter further let us take two of the most famous definitions to be found in the great books Both are definitions of man — featherless biped and rational animal As we have seen these definitions must remain purely nominal—only stating the meaning of the word man —until that word is used to name some kind of thing If however we apply the word man to existing entities which combine the characteristics of having two legs and lacking feathers then featherless biped defines not the word man but a class of real that is existing things In addition to being nominal the definition is now also real in the sense that the class or kind which it determines has existing members

That animals exist may similarly be a fact of observation But animal is only one of the two terms in the other nominal definition of man In order to make rational animal more than a nominal definition it is necessary to verify the existence of animals which possess a certain characteristic *rationality* not possessed by all animals If rationality in some degree belonged to all animals then the word man (nominally defined by rational animal) would be synonymous with animal But unlike feathers the presence or absence of which seems readily observable the possession or lack of rationality is difficult to ascertain

Here we face two possibilities One is that we can never be sure that some existing animals are and some are not rational Then the definition rational animal will never become real It will always remain merely nominal the statement of a possible meaning for man but one which we cannot employ when we apply the word to name any existing thing The other possibility is that we can infer the existence of a special class of animals (distinguished by the possession of reason) from such evident facts as the activities of reading and writing activities not performed by all animals Then members of the class defined having been found to exist rational animal becomes a real definition of

the beings to which we also arbitrarily give the name man

THE PROCESS of verification by which a nominal is converted into a real definition can be regarded as the demonstration of a definition Strictly speaking it is not the definition itself that is thereby proved It is rather a proposition in which the subject of the definition is affirmed to exist or in which a subject already known to exist is said to have a certain definition For example it is not the definition rational animal which is proved but the proposition — there exists an animal which differs from other animals in being rational or the proposition — the real being which we call man is both an animal and rational and he alone is rational If these propositions cannot be proved rational animal remains a purely nominal definition

That definitions are not as such either true or false is unaffected by the distinction between real and nominal definitions The point is simply that a definition which is always logically expressed by a phrase never a sentence neither affirms nor denies anything and so can not be either true or false Featherless biped or son of the same parents makes no assertion about reality or existence

Yet there is a special sense in which definitions can be true or false which does have bearing on the distinction between real and nominal definitions Pascal suggests three alternatives with regard to the truth or falsity of definitions If we find it impossible to prove it passes for false if we demonstrate that it is true it passes for a truth and as far as it cannot be proved to be either possible or impossible it is considered a fancy

According to Aquinas there are two ways in which a definition can be false In one way when the intellect applies to one thing the definition proper to another as that of a duck to a man In another way by composition a definition of parts which are mutually repugnant A definition such as a four footed rational animal would be of this kind — for such a statement as some rational animals are four footed is false in itself

But the truth or falsity of that statement can conceivably be argued and therefore it is not so clear an example of a false definition as re-

which in Pascal's terms plainly represents an impossibility. Suppose someone offered sound *sartre* at the nominal definition of *rectacy*.

The phrase *sound square* expresses a self-contradiction and in consequence the definition is false. Its falsity is tantamount to the possibility of there being any such figure as a rectangle which has the definition proposed. The truth of a definition—which is nothing more than its freedom from self contradiction—is equivalent to the possibility, as opposed to the impossibility of the thing defined. To call its definition son of the same parents or featherless biped *true* is to say that the words defined—brother or man—are *genuinely* possible existences. In short only those nominal definitions which are true can ever become real and they become real only when the possibility they signify is actually known to be realized in existence.

The version of Euclid's Elements illustrates the foregoing points. Euclid defines certain geometrical figures such as triangle, parallelogram, square. These definitions may appear to be free from contradiction but that does not tell us whether they are more than nominal. The defined figures are possible but the question is whether they exist in the space determined by Euclid's postulates.

To show that they do exist Euclid undertakes to constitute them according to his postulates which permit him the use of a straight edge and a compass for purposes of construction. When in Proposition 5 Euclid proves that he can construct an equilateral triangle he establishes the geometrical reality of the figure defined in Definition 20. A geometrical construction is thus seen to be what is called an existence proof. It comes in a nominal into a real definition. Figures which cannot be constructed can be postulated as, for example the straight line and the circle. Postulates 1 and 3 ask us to assume that a straight line can be drawn between any two points and that a circle can be described with any center and radius. These postulates give Definitions 4 and 15 their geometrical reality.

Though the method of construction is peculiar to geometry the relation of definitions to proof or postulates of existence is the same for

all sciences. Until a definition ceases to be nominal and becomes real it cannot be used scientifically in the demonstration of other conclusions to use a merely nominal definition in the proof begs the question.

If the existence of the thing defined is either directly observable or self evident no proof or postulation of existence is required. In theology for example there are those who think that the existence of God is immediately seen in the definition of God. Descartes and Spinoza seem to be of this opinion.

Descartes argues that eternal existence is necessarily included in the idea of God as a supremely perfect Being. This is so evident he declares that existence can no more be separated from the essence of God than can its having its three angles equal to two right angles be separated from the essence of a triangle or the idea of a mountain from the idea of a valley. Concerning substance or God Spinoza holds that since it pertains to its nature to exist its definition must involve necessary existence and consequently from its definition alone its existence must be concluded.

On the other hand there are those who think that the existence of God must be proved by inference from effect to cause. Supposing that a man understands the meaning of the word God Aquinas maintains that it does not therefore follow that he understands that what the name signifies exists actually but only that it exists mentally. Hence he declares it is necessary to prove the existence of God accepting as a middle term the meaning of the name but using an effect in place of the definition of the cause in proving the cause's existence.

The difference between these two positions might be summed up by saying that Descartes and Spinoza like Anselm before them think the definition of God is intrinsically real whereas Aquinas thinks we must begin with a nominal definition of God which becomes real only with proof of God's existence. For some confirmed atheists, any definition of God is not only nominal but false—the definition of an impossible being incapable of existing.

There is still another issue about nominal and real definition. The point involved is the one raised by Locke's discussion of nominal and real

adds there is an essence only of those things whose formula is a definition

Even supposing the truth of these statements which Hobbes or Locke certainly would question the problem of real as opposed to nominal definition requires further examination To explore the matter further let us take two of the most famous definitions to be found in the great books Both are definitions of man — featherless biped and rational animal As we have seen these definitions must remain purely nominal—only stating the meaning of the word man —until that word is used to name some kind of thing If however we apply the word man to existing entities which combine the characteristics of having two legs and lacking feathers then featherless biped defines not the word man but a class of real that is existing things In addition to being nominal the definition is now also real in the sense that the class or kind which it determines has existing members

That animals exist may similarly be a fact of observation But animal is only one of the two terms in the other nominal definition of man In order to make rational animal more than a nominal definition it is necessary to verify the existence of animals which possess a certain characteristic rationality not possessed by all animals If rationality in some degree belonged to all animals then the word man (nominally defined by rational animal) would be synonymous with animal But unlike feathers the presence or absence of which seems readily observable the possession or lack of rationality is difficult to ascertain

Here we face two possibilities One is that we can never be sure that some existing animals are and some are not rational Then the definition rational animal will never become real It will always remain merely nominal the statement of a possible meaning for man but one which we cannot employ when we apply the word to name any existing thing The other possibility is that we can infer the existence of a special class of animals (distinguished by the possession of reason) from such evident facts as the activities of reading and writing activities not performed by all animals Then members of the class defined having been found to exist rational animal becomes a real definition of

the beings to which we also arbitrarily give the name man

The process of verification by which a nominal is converted into a real definition may be regarded as the demonstration of a definition Strictly speaking it is not the definition itself which is thereby proved It is rather a proposition which the subject of the definition is affirmed to exist or in which a subject already known to exist is said to have a certain definition For example it is not the definition rational animal which is proved but the proposition

there exists an animal which differs from other animals in being rational or the proposition the real being which we call man is both an animal and rational and he alone is rational

If these propositions cannot be proved man

remains a purely nominal definition

That definitions are not as such either true or false is unaffected by the distinction between real and nominal definitions The point is simply that a definition which is always logically expressed by a phrase never a sentence neither affirms nor denies anything and so can not be either true or false Featherless biped or son of the same parents makes no assertions about reality or existence

Yet there is a special sense in which definitions can be true or false which does have bearing on the distinction between real and nominal definitions Pascal suggests three alternatives with regard to the truth or falsity of definitions If we find it impossible to prove it passes for false if we demonstrate that it is true it passes for a truth and as far as it cannot be proved to be either possible or impossible it is considered a fancy

According to Aquinas there are two ways in which a definition can be false In one way when the intellect applies to one thing the definition proper to another as that of a circle to a man In another way by composition a definition of parts which are mutually repugnant A definition such as a four footed rational animal would be of this kind for such a statement as some rational animals are four footed is false in itself

But the truth or falsity of that statement can conceivably be argued and therefore it is not so clear an example of a false definition as the

such in Pascal's terms plainly represents an possibility. Suppose someone offered round ware as the nominal definition of rectaty

The phrase round square expresses a contradiction and in consequence the definition is false. Its falsity is tantamount to the possibility of there being any such figure as a rectangle which has the definition proposed. The truth of a definition—which is nothing more than its freedom from self contradiction—is equal to the possibility as opposed to the impossibility of the thing defined. To call a definition son of the same parents or brotherless biped true is to say that the words defined—brother or man—signify possible entities. In short only those nominal definitions which are true can ever become real and may become real only when the possibility signified is actually known to be realized in existence.

THE METHOD OF EUCLID'S ELEMENTS illustrates the foregoing points. Euclid defines certain geometrical figures such as triangle, parallelogram, square. These definitions may appear to be free from contradiction but that does not tell us whether they are more than nominal. The defined figures are possible but the question is whether they exist in the space determined by Euclid's postulates.

To show that they do exist Euclid undertakes to construct them according to his postulates which permit him the use of a straight edge and a compass for purposes of construction. When in Proposition 1 Euclid proves that he can construct an equilateral triangle he establishes the geometrical reality of the figure defined. Definition 20 A geometrical construction is thus seen to be what is called an existence proof. It converts a nominal into a real definition. Figures which cannot be constructed must be postulated as, for example the straight line and the circle. Postulates 1 and 2 ask us to assume that a straight line can be drawn between any two points and that a circle can be described with any center and radius. These postulates give Definitions 4 and 15 their geometrical reality.

Though the method of construction is peculiar to geometry the relation of definitions to proofs or possibilities of existence is the same for

all sciences. Until a definition ceases to be nominal and becomes real it cannot be used scientifically in the demonstration of other conclusions to use a merely nominal definition in the proof begs the question.

If the existence of the thing defined is either directly observable or self evident no proof or postulation of existence is required. In theology for example there are those who think that the existence of God is immediately seen in the definition of God. Descartes and Spinoza seem to be of this opinion.

Descartes argues that eternal existence is necessarily included in the idea of God as a supremely perfect Being. This is so evident he declares that existence can no more be separated from the essence of God than can its having its three angles equal to two right angles be separated from the essence of a triangle or the idea of a mountain from the idea of a valley. Concerning substance or God Spinoza holds that since it pertains to its nature to exist its definition must involve necessary existence and consequently from its definition alone its existence must be concluded.

On the other hand there are those who think that the existence of God must be proved by inference from effect to cause. Supposing that a man understands the meaning of the word God Aquinas maintains that it does not therefore follow that he understands that what the name signifies exists actually but only that it exists mentally. Hence he declares it is necessary to prove the existence of God accepting as a middle term the meaning of the name but using an effect in place of the definition of the cause in proving the cause's existence.

The difference between these two positions might be summed up by saying that Descartes and Spinoza like Anselm before them think the definition of God is intrinsically real whereas Aquinas thinks we must begin with a nominal definition of God which becomes real only with proof of God's existence. For some confirmed atheists any definition of God is not only nominal but false—the definition of an impossible being incapable of existing.

THERE IS STILL another issue about nominal and real definitions. The point involved is the one raised by Locke's discussion of nominal and real

adds there is an essence only of those things whose formula is a definition

Even supposing the truth of these statements which Hobbes or Locke certainly would question the problem of real as opposed to nominal definition requires further examination To explore the matter further let us take two of the most famous definitions to be found in the great books Both are definitions of man — featherless biped and rational animal As we have seen these definitions must remain purely nominal—only stating the meaning of the word man —until that word is used to name some kind of thing If, however we apply the word man to existing entities which combine the characteristics of having two legs and lacking feathers then featherless biped defines not the word man but a class of real that is existing things In addition to being nominal the definition is now also real in the sense that the class or kind which it determines has existing members

That animals exist may similarly be a fact of observation But animal is only one of the two terms in the other nominal definition of man In order to make rational animal more than a nominal definition it is necessary to verify the existence of animals which possess a certain characteristic rationality not possessed by all animals If rationality in some degree belonged to all animals then the word man (nominally defined by rational animal) would be synonymous with animal But unlike feathers the presence or absence of which seems readily observable the possession or lack of rationality is difficult to ascertain

Here we face two possibilities One is that we can never be sure that some existing animals are and some are not rational Then the definition rational animal will never become real It will always remain merely nominal the statement of a possible meaning for man but one which we cannot employ when we apply the word to name any existing thing The other possibility is that we can infer the existence of a special class of animals (distinguished by the possession of reason) from such evident facts as the activities of reading and writing activities not performed by all animals Then members of the class defined having been found to exist rational animal becomes a real definition of

the beings to which we also arbitrarily assign the name man

THE PROCESS OF VERIFICATION by which a nominal is converted into a real definition can be regarded as the demonstration of a definition. Strictly speaking it is not the definition itself which is thereby proved It is rather a proposition in which the subject of the definition is affirmed to exist or in which a subject already known to exist is said to have a certain definition For example it is not the definition rational animal which is proved but the proposition there exists an animal which differs from other animals in being rational or the proposition the real being which we call man is both an animal and rational and he alone is rational If these propositions cannot be proved rational animal remains a purely nominal definition.

That definitions are not as such either true or false is unaffected by the distinction between real and nominal definitions The point is simply that a definition which is always logically expressed by a phrase never a sentence neither affirms nor denies anything and so can not be either true or false Featherless biped or son of the same parents makes no assertion about reality or existence

Yet there is a special sense in which definitions can be true or false which does have bearing on the distinction between real and nominal definitions Pascal suggests three alternatives with regard to the truth or falsity of definitions If we find it impossible to write it passes for false if we demonstrate that it is true it passes for a truth and as long as it cannot be proved to be either possible or impossible it is considered a fancy

According to Aquinas there are two ways in which a definition can be false In one way when the intellect applies to one thing the definition proper to another as that of a centaur to a man In another way by composing a definition of parts which are mutually repugnant A definition such as a four footed rational animal would be of this kind — for such a statement as some rational animals are four footed is false in itself

But the truth or falsity of that statement can conceivably be argued and therefore it is not so clear an example of a false definition as one

but feet it makes a difference according to Aristotle what terms are then used to differentiate footed animals into their proper sub-lives.

"It is necessary," he writes, "that the division be by the differentia of the *differentia*, e.g., endowed with feet is a differentia of animal just as the differentia of animal endowed with feet must be of all *qua*s endowed with feet. Therefore we must not say if we are to speak wholly that of that which is endowed with feet one part has feathers and one is featherless (if we do this we do it through incapacity) we must divide it only into cloven-footed and not cloven, for these are differentiae in the foot. Cloven footedness is a form of footedness. And the process wants always to go on so till it reaches the species that contains no difference. And then there will be as many kinds of foot as there are differentiae and the kinds of animals endowed with feet will be equal in number to the differentiae. If then this is so clearly the *vis differentia* will be the essence of the thing and its definition."

As Aristotle quarrels with Plato's method of *definition* so William James takes issue with Aristotle's theory that a real essence is defined when the right differentia is properly chosen within a certain genus of things. He tends to follow Locke's notion that definitions indicate no more than the nominal essences of things, but he gives this theory a special twist by adding the notion that all our definitions merely group things according to the interest or purpose, whether theoretical or practical which motivates our classification of them. This has come to be known as the *pragmatic theory of definition*.

"My thinking," writes James, "is first and last and always for the sake of my doing. After pointing out that Locke undermined the failure of supposing that we can define the real essences of things, he goes on to say that "none of his successors, as far as I know, have radically escaped it or seen that the only meaning of essence is teleological. And the classifications are concessions at purely teleological avowals, if I may say so. The essence of things is that one of its properties which is so important for my interests is the comparison with what I may select the things. The properties which are important

vary from man to man and from hour to hour."

In a footnote James adds: "A substance like oil has as many different essences as it has uses to different individuals. The classification of natural as well as artificial objects should therefore proceed according to the advice Mephistopheles gives to the student in Goethe's *Faust*:

You will have more success," he says, "if you will learn to reduce all and to classify each according to its use. But if this is so, then no one scheme of classification, more than any other represents the real structure or order of nature. Nature indifferently submits to any and all divisions which we wish to make among existing things. Some classifications may be more significant than others but only by reference to our interests, not because they represent reality more accurately or adequately. It does not matter therefore whether we define by genus and differentia by other characteristics in combination or by reference to origins or functions."

Darwin's scheme of classification provides evidence relevant to this whole issue. As indicated in the chapters on *Natural and Evolution* Darwin thinks that his genealogical classification of plants and animals comes nearer to the natural system of living organisms than the classifications proposed by his predecessors. "The Natural System," he writes, "is a genealogical arrangement with the acquired grades of difference marked by the terms species, genera, families, etc. and we have to discover the lines of descent by the most permanent characters whatever they may be and of however slight vital importance. Henceforth, following his method, systematists will have only to decide whether any form be sufficiently constant and distinct from other forms, to be capable of definition and if definable whether the differences be sufficiently important to deserve a specific name."

But Darwin's statement re-opens rather than resolves the great traditional questions. Are the various groupings made in classification divisions which the classifier finds useful to impose on nature or do they represent lines of real distinction in the very nature of things? If the latter is the case either wholly or in part are we able to do more than approximate real distinction by whatever method of definition we employ? Can we discover real species, essen-

essences It is also rused by Aristotle's discrimination between essential and accidental unities i.e. the difference between the unity signified by the phrase featherless biped and by the phrase black man Both phrases look like definitions Each designates a possible class of individuals and sets up the conditions for membership in that class or exclusion from it

The distinction between them does not rest according to Aristotle on the criterion of existence Both of the objects defined may exist but whereas the first is truly a species the second is only in Aristotle's opinion an accidental variety within the species *man* *Man* being a species can have a real essence and so the definition of man—whether featherless biped or rational animal—can be a real definition constituted by genus and differentia But *negro* or *arjan* not being a species but only a race or variety has no essence as such The definitions—black man and white man—indicate this in that they are constituted by two terms which are related as substance and accident not as genus and differentia

Though Aristotle distinguishes these two types of formulae as essential and accidental definitions rather than as real and nominal definitions the one principle of distinction is closely related to the other for only essential definitions can have real essences for their objects Accidental definitions do little more than state the meanings of words or express what Locke calls the nominal essences of things He doubts that the definition of any thing except a mathematical object can ever grasp the real essence of a thing For him all definitions are nominal which is equivalent to saying that we never define by means of the true genus and differentia but always by accidental and external signs or by stating the component parts of a complex whole

Speaking of a man or gold Locke explains—or any other species of natural substance as supposed constituted by a precise and real essence which nature regularly imparts to every individual of that kind whereby it is made to be of that species we cannot be certain of the truth of any affirmation or negation made of it For man or gold taken in this sense and used for species of things constituted by real essences different from the complex idea

in the mind of the speaker stand for neither not what and the extent of these species wth such boundaries are so unknown and undetermined that it is impossible with any certainty to affirm that all men are rational or that gold is yellow

THIS ISSUE HAS MANY ramifications In one direction it leads into Aristotle's quarrel with Plato over the method of definition by division or dichotomy In the *Sophist* and the *Satyricon* the search for definitions proceeds by the division of a class of things into two sub-classes one of which is then further subdivided and so on until a class is reached which has the characteristics of the object to be defined The attempt to define a sophist for example starts with the notion that he is a man of art and proceeds by dividing and subdividing the various kinds of art At one point in the course of doing this the Athenian Stranger summarizes the process to that point

You and I he says to Theaetetus have come to an understanding not only about the name of the angler's art but about the definition of the thing itself One half of all art was acquisitive—half of the acquisitive art was conquest or taking by force half of this was hunting and half of hunting was hunting animals half of this was hunting water animals—of this again the under half was fishing half of fishing was striking a part of striking was fishing with a barb and one half of this again being the kind which strikes with a hook and draws the fish from below upwards is the art which we have been seeking and which from the nature of the operation is denoted angling or drawing up And now following this pattern he continues let us endeavor to find out what a Sophist is

The pattern as illustrated indicates that in the course of division one of the two classes is discarded while the other is subject to further subdivision Aristotle's criticism of this procedure turns partly on the fact that the division is always dichotomous or into two sub-classes and partly on the fact that the terms which Plato uses in a succession of subdivisions do not seem to have any systematic relation to one another If the class of animals for example is divided into those with and those without

## REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passage referred to. For example, in 4 Hours, I, I, § 11; 6, ¶ 3] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 1.

Page 5 contains When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in *Saint Peter* folio 116a-119b, the passage begins in the upper half of p. 116 and ends in the lower half of p. 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in *Plant Stories*, folio 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

**Author's Division.** One or more of the main divisions of a work (such as PART, SEC., CH., VOL.) are sometimes included in the reference line numbers, in brackets, are given in certain cases, e.g. *Part xxii [6] 32122*.

BIBLE REF. IN CH. The references are to book, chapter and verse. When the King James and Douay versions differ in the number of chapters or verses, the King James version is cited first and the Douay version is in parentheses. e.g., OLD TESTAMENT, 1 Kings 17:1-17 (D) II Esdras 1:16

**Strikes** The abbreviation "esp." calls the reader's attention to one or more especially relevant parts of "whole reference pattern" so as that the topic is discussed intermittently rather than continuous in the work or story.

For all journal information concerning the style of the references, see the Explanation of Reference Style for general guidance in the use of *The Great Lakes*; consult the Preface.

tially distinct from one another, and can our definitions formulate the essence of each?

**THE SEARCH FOR DEFINITIONS** basically belongs to the activity of the human mind in all its scientific or dialectical efforts to clarify discourse to achieve precision of thought to focus issues and to resolve them.

Men have no other way of coming to terms with one another than by defining the words they use to express their concepts or meanings. They make terms out of words by endowing words with exactness or precision of meaning. Definition does this and makes possible the meeting of minds either in agreement or in dispute. Definition also makes it possible for any

mind to submit itself to the test of agreement with reality. Definition helps man to know or experience the only sort of question to which answers can be found.

The search for definitions has perhaps its most dramatic exemplification in the dialogues of Plato. Socrates usually leads the converses in quest of them though it is only in certain dialogues such as the *Sophist* and the *Statesman* that the making of definitions is pursued in detail. Two other books in this set are largely concerned with ways of reaching and defending definitions—Aristotle's *Topics* (which should be considered together with the opening chapter of his *Parts of Animals*) and Bacon's *Organum*.

## OUTLINE OF TOPICS

1	The theory of definition	
1a	The object of definition definitions as arbitrary and nominal or real and concerned with essence	
1b	The purpose of definition the classification of ideas	26
1c	The limits of definition the definable and the indefinable	
1d	The unity of a definition in relation to the unity of the thing defined	27
1e	The truth and falsity of definitions	
2	The various methods of definition or classification	
2a	The use of division or dichotomy in definition	
2b	Definition by genus and differentia properties	
2c	Definition by accidental or extrinsic signs or by component parts	28
2d	The appeal to genesis origin cause or end in definition	
2e	Definition by reference to purpose or interest	
3	The grammatical or verbal aspects of definition	29
4	The search for definitions and the methods of defending them	
5	Definition and demonstration definitions as principles and as conclusions	
6	The character of definitions in diverse disciplines	30
6a	The formulation of definitions in physics mathematics and metaphysics	
6b	The use of definition in speculative philosophy and empirical science	
6c	The role of definitions in practical or moral philosophy and the social sciences	31

# Chapter 16 DEMOCRACY

## INTRODUCTION

Of all the traditional names for forms of government "democracy" has the liveliest currency today. Yet like all the others, it has a long history in the literature of political thought and a career of shifting meanings. How radically the various conceptions of democracy differ may be judged from the fact that in one of its meanings democracy flourished in the Greek city-states as early as the fifth century B.C., while in another democracy only begins to exist in recent times or perhaps does not yet exist anywhere in the world.

In our minds democracy is inseparably connected with constitutional government. We tend to think of despotism or dictatorship as its opposite or enemies. That is how the major political issue of our day is understood. But as recently as the 18th century some of the American constitutionalists preferred a republicanism of government to democracy, and also their successors, both ancient and modern, of "republic" or "empire" rather than monarchy or despotism, is the major alternative. Democracy has even tended for the lawless rule of the mob—either it was a kind of tyranny or the immediate prevalence of it.

Throughout all these shifts in meaning and use the word "democracy" preserves certain original political connotations. Democracy exists according to the way in which the body of the people is possessed of the supreme power. In this sense the word indicates democra-tia, the rule of the people. While there can be no doubt often has been a difference of opinion as to respect to the meaning of "the people," the notion has been traditionally associated with the doctrine of popular sovereignty which makes the political community as such the center and basis of political authority. In the development of the democratic tradition particular regard to this fact has been accen-

tuated by the elaboration of safeguards for the rights of man to assure that government actually functions for the people and not merely for one group of them.

Although they are essential parts of democracy neither popular sovereignty nor the safe-guarding of natural rights provides the specific characteristic of democracy since both are compatible with any other just form of government. The specifically democratic element is apparent from the fact that throughout the many shifts of meaning which democracy has undergone the common thread is the notion of political power in the hands of the many, rather than the few or the one. Thus at the very beginning of democratic government we find Pindar's calling Athens a democracy because "its administration favours the many instead of the few." Close to our own day Mill likewise holds that democracy is "the government of the whole people by the whole people in which the majority will prevail and prevail."

According as the many exercise legal power as citizens or merely actual power as a mob democracy is aligned with or against constitutional government. The quantitative meaning of "many" can vary from more than the few to all or something approximately all, and with this variance the same constitution may be at one time regarded as oligarchical or aristocratic and at another as democratic. The way in which the many who are citizens exercise their power—either directly or through representatives creates the 18th century distinction between a democracy and a republic though this verbal ambiguity can be easily avoided by us, i.e., the phrases "direct democracy" and "representative democracy" as was sometimes done by the writers of *The Federalist* and their American contemporaries.

These last two points—the extension of the

## ADDITIONAL READINGS

Listed below are works not included in *Great Books of the Western World* but relevant to the idea and topics with which this chapter deals. These works are divided into two groups:

- I Works by authors represented in this collection
- II Works by authors not represented in this collection

For the date, place and other facts concerning the publication of the works cited consult the Bibliography of Additional Readings which follows the last chapter of *The Great Ideas*.

Alexander Hamilton and others involved in the American constitutional debates, as for example James Wilson occasionally call this system a representative democracy but in The Federalist in a republic is sharply differentiated from a democracy. The great points of difference however turn out to be only the delegation of the government (in a republic) to a small number of citizens elected by the rest and the greater number of citizens, and greater sphere of country to which a republic may extend. The difference as already noted is best expressed in the words representative and direct democracy.

In Mill's *Representative Government* we find democracy identified with the ideal state. The ideally best form of government he writes is that in which the so called sovereignty or supreme controlling power in the last resort is vested in the entire aggregate of the community every citizen not only having a voice in the exercise of that ultimate sovereignty but being at least occasionally called on to take an actual part in the government by the personal discharge of some public function local or general. Though Mill recognizes the infirmities of democracy and though he readily concedes that it may not be the best government for all peoples under all circumstances his argument for its superiority to all other forms of government remains substantially unqualified.

In Mill's construction of the democratic ideal as providing liberty and equality for all the essential distinction from previous conceptions lies in the meaning of the word *all*. The republicans of the 18th century in their doctrines of popular sovereignty and natural rights understood citizenship in terms of equality of status and concerned liberty in terms of a man's having a voice in his own government. The ancients seeing that men could be free and equal members of a political community only when they lived ascetically under the rule of law recognized that the democratic constitution alone bestowed such equality upon all men not born slaves. But generally neither the ancients nor the 18th century republican understood liberty and equality for all men to require the abolition of slavery the emancipation of women from political subjection or the eradication of all con-

stitutional discriminations based on wealth race or previous condition of servitude.

With Mill all means every human person without regard to the accidents of birth or fortune. There ought to be no parahs in a full grown and civilized nation he writes no persons disqualified except through their own default. Under the latter condition he would withhold the franchise from infants idiots or criminals (including the criminally indigent) but with these exceptions he would make suffrage universal. He sums up his argument by claiming that it is a personal injustice to withhold from any one unless for the prevention of greater evils the ordinary privilege of having his voice reckoned in the disposal of affairs in which he has the same interest as other people and who ever has no vote and no prospect of obtaining it will either be a permanent malcontent or will feel as one whom the general affairs of society do not concern. But it should be added that for Mill the franchise is not merely a privilege or even a right it is he says strictly a matter of duty. How the voter uses the ballot has no more to do with his personal wishes than the verdict of a juryman. He is bound to give it according to his best and most conscientious opinion of the public good. Whoever has any other idea of it is unfit to have the suffrage.

The notion of universal suffrage raises at once the question of the economic conditions prerequisite to the perfection of political democracy. Can men exercise the political freedom of citizenship without freedom from economic dependence on the will of other men? It was commonly thought by 18th century republicans that they could not. A power over a man's subsistence Hamilton declares amounts to a power over his will. On that basis it was urged by many during the Philadelphia convention that a property qualification was necessary for suffrage.

Kant also argues that suffrage presupposes the independence or self sufficiency of the individual citizen. Because apprentices servants minors women and the like do not maintain themselves, each according to his own industry but as it is arranged by others. He claims that they are mere subservient of the Commonwealth and not active independent members of

franchise and a system of representation—mark the chief differences between ancient and contemporary institutions of democracy. Today constitutional democracy tends to be representative and the grant of citizenship under a democratic constitution tends toward universal suffrage. That is why we no longer contrast democracy and republic. That is why even the most democratic Greek constitutions may seem undemocratic—oligarchical or aristocratic—to us.

To the extent that democracy, ancient or modern, is conceived as a lawful form of government it has elements in common with other forms of lawful government which for one reason or another may not be democratic. The significance of these common elements—the principle of constitutionality and the status of citizenship—will be assumed here. They are discussed in the chapters on CONSTITUTION and CITIZEN. The general theory of the forms of government is treated in the chapter on GOVERNMENT and the two forms most closely related to democracy in the chapters on ARISTOCRACY and OLIGARCHY.

THE EVALUATIONS of democracy are even more various than its meanings. It has been denounced as an extreme perversion of government. It has been grouped with other good or other bad forms of government and accorded the faint praise of being called either the most tolerable of bad governments or the least efficient among acceptable forms. It has been held up as the political ideal, the only perfectly just state—that paragon of justice which has always been whether recognized or not the goal of political progress.

Sometimes the same writer will express divergent views. Plato, for example, in the *Statesman* claims that democracy has a twofold meaning according as it involves ruling with law or without law. Finding it in every respect weak and unable to do either any great good or any great evil, he concludes that it is the worst of all lawful governments and the best of all lawless ones. The rule of the many is least efficient for either good or evil. But in the *Republic* he places democracy at only one remove from tyranny. On the ground that the excessive increase of anything often causes a reaction in the opposite direction, tyranny is

said to arise naturally out of democracy and the most aggravated form of tyranny and slavery out of the most extreme form of liberty.

Similarly Aristotle in the *Politics* calls democracy the most tolerable of the three diverted forms of government in contrast to oligarchy which he thinks is only a little better than tyranny—the worst of governments. Yet he also notes that among existing governments there are generally thought to be two principal forms—democracy and oligarchy and the rest are only variations of these. His own treatment conforms with this observation. He devotes the central portion of his *Politics* to the analysis of oligarchy and democracy. In his view they are equal and opposite in their injustice, and to him both seem capable of degenerating into despotism and tyranny.

Among the political philosophers of modern times a certain uniformity of treatment seems to prevail in the context of otherwise divergent theories. Writers like Hobbes, Locke and Rousseau or Machiavelli, Montesquieu and Kant differ in many and profound respects, but they classify the forms of government in much the same fashion. As Hobbes expresses it when the representative is one man then is the commonwealth a monarchy; when an assembly of all that will come together then it is a democracy or popular commonwealth; when an assembly of a part only then it is called an aristocracy. Though Hobbes favors monarchy and Montesquieu either aristocracy or democracy, these writers do not make the choice among the three traditional forms a significant expression of their own political theories. For them the more important choice is presented by other alternatives: for Hobbes between absolute and limited government; for Montesquieu and Locke between government by law and despotism; for Rousseau and Kant between a republic and a monarchy.

The authors of *The Federalist* show their preference for popular government as opposed to monarchy, aristocracy or oligarchy. They usually refer to it as a republic by which they mean a government which derives all its powers directly or indirectly from the great body of the people and is administered by persons holding their offices during pleasure for a limited period or during good behavior.

Alexander Hamilton and others involved in the American constitutional debates as for example James Wilson, occasionally call this system a representative democracy but in *The Federalist* a republic is sharply differentiated from a democracy. The great points of difference however turn out to be only the delegation of the government (in a republic) to a small number of citizens elected by the rest and the greater number of citizens and greater sphere of country to which a republic may extend. The difference as already noted is best expressed in the words representative and direct democracy.

In Mill's *Representative Government* we find democracy identified with the ideal state 'The ideally best form of government' he writes 'is that in which the sovereignty or supreme controlling power in the last resort is vested in the entire aggregate of the community every citizen not only having a voice in the exercise of that ultimate sovereignty but being at least occasionally called on to take an actual part in the government by the personal discharge of some public function local or general'. Though Mill recognizes the infirm ties of democracy and though he readily concedes that it may not be the best government for all peoples under all circumstances his argument for its superiority to all other forms of government remains substantially unqualified.

In Mill's construction of the democratic ideal as providing liberty and equality for all the essential distinction from previous conceptions lies in the meaning of the word 'all'. The republicans of the 18th century in their doctrines of popular sovereignty and natural rights understood citizenship in terms of equality of status and conceded liberty in terms of a man's having a voice in his own government. The ancients seeing that men could be free and equal members of a political community only when they lived as citizens under the rule of law recognized that the democratic constitution alone bestowed such equality upon all men not born slaves. But generally neither the ancients nor the 18th century republican understood liberty and equality for all men to require the abolition of slavery the emancipation of women from political subjection or the eradication of all con-

stitutional discriminations based on wealth race or previous condition of servitude.

With Mill all means every human person without regard to the accidents of birth or fortune. 'There ought to be no paupers in a full grown and civilized nation' he writes 'no persons disqualified except through their own default'. Under the latter condition he would withhold the franchise from infants, idiots or criminals (including the criminally indigent) but with these exceptions he would make suffrage universal. He sums up his argument by claiming that 'it is a personal injustice to withhold from any one unless for the prevention of greater evils the ordinary privilege of having his voice reckoned in the disposal of affairs in which he has the same interest as other people and whoever has no vote and no prospect of obtaining it will either be a permanent malcontent or will feel as one whom the general affairs of society do not concern'. But it should be added that for Mill the franchise is not merely a privilege or even a right 'it is' he says 'strictly a matter of duty'. How the voter uses the ballot has no more to do with his personal wishes than the verdict of a juryman. He is bound to give it according to his best and most conscientious opinion of the public good. Whoever has any other idea of it is unfit to have the suffrage.

The notion of universal suffrage raises at once the question of the economic conditions prerequisite to the perfection of political democracy. Can men exercise the political freedom of citizenship without freedom from economic dependence on the will of others? It was commonly thought by 18th century republicans that they could not. A property over a man's subsistence Hamilton declares, amounts to a property over his will. On that basis it was urged by many during the Philadelphia convention that a property qualification was necessary for suffrage.

Kant also argues that suffrage presupposes the independence or self-sufficiency of the individual citizen. Because apprentices, servants, minors, women and the like do not maintain themselves each according to his own industry but as it is arranged by others he claims that they are mere subsidiaries of the Commonwealth and not active independent members of

franchise and a system of representation—mark the chief differences between ancient and contemporary institutions of democracy. Today constitutional democracy tends to be representative and the grant of citizenship under a democratic constitution tends toward universal suffrage. That is why we no longer contrast democracy and republic. That is why even the most democratic Greek constitutions may seem undemocratic—oligarchical or aristocratic—to us.

To the extent that democracy, ancient or modern, is conceived as a lawful form of government it has elements in common with other forms of lawful government which for one reason or another may not be democratic. The significance of these common elements—the principle of constitutionality and the status of citizenship—will be assumed here. They are discussed in the chapters on CONSTITUTION and CITIZEN. The general theory of the forms of government is treated in the chapter on GOVERNMENT and the two forms most closely related to democracy in the chapter on ARISTOCRACY and OLIGARCHY.

THE EVALUATIONS of democracy are even more various than its meanings. It has been denounced as an extreme perversion of government. It has been grouped with other good or other bad forms of government and accorded the faint praise of being called either the most tolerable of bad governments or the least efficient among acceptable forms. It has been held up as the political ideal, the only perfectly just state—that paragon of justice which has always been whether recognized or not the goal of political progress.

Sometimes the same writer will express divergent views. Plato for example in the *Statesman* claims that democracy has a twofold meaning according as it involves ruling with law or without law. Finding it in every respect weak and unable to do either any great good or any great evil he concludes that it is

the worst of all lawful governments and the best of all lawless ones. The rule of the many is least efficient for either good or evil. But in the *Republic* he places democracy at only one remove from tyranny. On the ground that the excessive increase of anything often causes a reaction in the opposite direction, tyranny is

said to arise naturally out of democracy; the most aggravated form of tyranny and slavery out of the most extreme form of liberty.

Similarly Aristotle in the *Politics* calls democracy the most tolerable of the three perverted forms of government in contrast to oligarchy which he thinks is only a little better than tyranny—the worst of governments. Yet he also notes that among existing governments there are generally thought to be two principal forms—democracy and oligarchy and the rest are only variations of these. His own treatment conforms with this observation. He devotes the central portion of his *Politics* to the analysis of oligarchy and democracy. In his view they are equal and opposite in their injustice, and to him both seem capable of degenerating into despotism and tyranny.

Among the political philosophers of modern times a certain uniformity of treatment seems to prevail in the context of otherwise divergent theories. Writers like Hobbes, Locke, and Rousseau or Machiavelli, Montesquieu, and Kant differ in many and profound respects. But they classify the forms of government in much the same fashion. As Hobbes expresses it when the representative is one man then is the commonwealth a monarchy; when an assembly of all that will come together then it is a democracy or popular commonwealth; when an assembly of a part only then it is called an aristocracy. Though Hobbes favors monarchy and Montesquieu either aristocracy or democracy, these writers do not make the choice among the three traditional forms a significant expression of their own political theories. For them the more important choice is presented by other alternatives. For Hobbes between absolute and limited government; for Montesquieu and Locke between government by law and despotism; for Rousseau and Kant between a republic and monarchy.

The authors of *The Federalist* definitely show their preference for popular government as opposed to monarchy, aristocracy, or oligarchy. They usually refer to it as a republic by which they mean a government which derives all its powers directly or indirectly from the great body of the people and is administered by persons holding their offices during pleasure for a limited period or during good behavior.

Alexander Hamilton and others involved in the American constitutional debates, as for example James Wilson, occasionally call this system a representative democracy, but in *The Federalist* a republic is sharply differentiated from a democracy. The great points of difference "however turn out to be only the delegation of the government (in a republic) to a small number of citizens elected by the rest" and the "greater number of citizens, and greater sphere of country" to which a republic may extend. The difference as already noted is best expressed in the words representative and "direct" democracy.

In Mill's *Representative Government*, we find democracy identified with the ideal state "The ideally best form of government," he writes, is that in which the sovereign or supreme controlling power in the last resort is vested in the entire aggregate of the community every citizen not only having a voice in the exercise of that ultimate sovereignty but being at least occasionally called on to take an actual part in the government by the personal discharge of some public function local or general. Though Mill recognizes the infirmities of democracy and though he readily concedes that it may not be the best government for all peoples under all circumstances, his argument for its supremacy to all other forms of government remains substantially unqualified.

In Mill's construction of the democratic ideal as providing liberty and equality for all, the essential distinction from previous conceptions lies in the meaning of the word "liberty." The republicans of the 18th century in their doctrines of popular sovereignty and natural rights, understood citizenship in terms of equality of status and conceded liberty in terms of a man's having a voice in his own government. The ancients, seeing that men could be free and equal members of a political community only when they lived as citizens under the rule of law recognized that the democratic constitution alone bestowed such equality upon all men not born slaves. But generally neither the ancients nor the 18th century republicans understood liberty and equality for all men to require the abolition of slavery, the emancipation of women from political subjection or the eradication of all eco-

nomic discriminations based on wealth race or previous condition of servitude.

With Mill all means every human person without regard to the accidents of birth or fortune. There ought to be no parasite in a full grown and civilized nation, he writes, "no persons disqualified except through their own default." Under the latter condition he would withhold the franchise from infants, idiots, or criminals (including the criminally indigent) but with these exceptions he would make suffrage universal. He sums up his argument by claiming that it is a personal injustice to withhold from any one unless for the prevention of greater evils, the ordinary privilege of having his voice reckoned in the disposal of affairs in which he has the same interest as other people" and whoever "has no vote and no prospect of obtaining it will either be a permanent malcontent or will feel as one whom the general affairs of society do not concern. But it should be added that for Mill the franchise is not merely a privilege or even a right "it is," he says, "strictly a matter of duty." How the voter uses the ballot has no more to do with his personal wishes than the verdict of a jurymen. He is bound to give it according to his best and most conscientious opinion of the public good. Who ever has any other idea of it is unfit to have the suffrage.

The notion of universal suffrage raises at once the question of the economic conditions prerequisite to the perfection of political democracy. Can men exercise the political freedom of citizenship without freedom from economic dependence on the will of other men? It was commonly thought by 18th century republicans that they could not. A property over a man's subsistence" Hamilton declares, "amounts to a power over his will." On that basis it was urged by many during the Philadelphia convention that a property qualification was necessary for suffrage.

Kant also argues that suffrage "presupposes the independence or self-sufficiency of the individual citizen." Because apprentices, servants, minors, women, and the like do not maintain themselves, each according to his own industry but as it is arranged by others, he claims that they are "mere subordinates of the Commonwealth and not active independent members of

THE ANCIENT ISSUE between the democratic and the oligarchical constitution turns primarily on a question of justice not on the relative competence of the many and the few to rule. Either form of government may take on a more or less aristocratic cast according as men of eminent virtue or ability assume public office but in neither case does the constitution itself guarantee their choice except possibly on the oligarchical assumption that the possession of wealth signifies superior intelligence and virtue.

The justice peculiar to the democratic constitution Aristotle thinks arises out of the notion that those who are equal in one respect are equal in all respects because men are equally free they claim to be absolutely equal. It does not seem to him inconsistent with democratic justice that slaves women and resident aliens should be excluded from citizenship and public office.

In the extreme form of Greek democracy the qualifications for public office are no different from the qualifications for citizenship. Since they are equally eligible for almost every governmental post the citizens can be chosen by lot rather than elected by vote. Rousseau agrees with Montesquieu's opinion of the Greek practice that election by lot is democratic in nature. He thinks it would have few disadvantages in a real democracy but he adds:

I have already said that a real democracy is only an ideal.

The justice peculiar to the oligarchical constitution is according to Aristotle based on the notion that those who are unequal in one respect are in all respects unequal being unequal that is in property they suppose themselves to be unequal absolutely. The oligarchical constitution consequently does not grant citizenship or open public office to all the free born but in varying degrees sets a substantial property qualification for both.

Though he admits that the opposite claims of the oligarch and the democrat have a kind of justice Aristotle also points out the injustice of each. The democratic constitution he thinks does injustice to the rich by treating them as equal with the poor simply because both are freeborn while the oligarchical constitution does injustice to the poor by failing to treat all free men regardless of wealth as

equals. Tried by an absolute standard the state goes on to say they are faulty and therefore both parties whenever their share in the government does not accord with the preconceived ideas stir up a revolution.

Plato Thucydides and Plutarch as well as Aristotle observe that this unstable situation permits demagogue or dynast to encourage lawless rule by the mob or by a coterie of the rich. Either paves the way to tyranny.

To stabilize the state and to remove injustice Aristotle proposes a mixed constitution which by a number of different methods attempts to unite the freedom of the poor and the wealth of the rich. In this way he hopes to satisfy the two requirements of good government. One is the actual obedience of citizens to the laws the other is the goodness of the laws which they obey. By participating in the making of laws all free men the poor included, would be more inclined to obey them. But since the rich are also given a special function there is according to Aristotle the possibility of also getting good laws passed since birth and education are commonly the accompaniments of wealth.

To Aristotle the mixed constitution is perfectly just and with an aristocratic aspect added to the blend it approaches the ideal polity. Relative to certain circumstances it is greater right than any other form of government except the true and ideal to the name of the government of the best.

Yet the true and the ideal or what he sometimes calls the divine form of government seems to be monarchy for Aristotle or rule by the one superior man and in his own sketch of the best constitution at the end of the *Politics*—the best practicable if not the ideal—Aristotle clearly opposes admitting all the laboring classes to citizenship.

AS INDICATED IN the chapter on Constitution Aristotle's mixed constitution should be distinguished from the mediæval mixed regime which was a combination of constitutional with non constitutional or absolute government rather than a mixture of different constitutional principles. The mixed regime—or royal and political government—seems to have come into being not as an attempt to

concl) conflictin, principles of justice but is the inevitable product of a decaying feudalism and a rising national sm Yet Aquinas claims that a mixed regime was established by the law for the people of Israel for it was partly kingdom since there is one at the head of all partly aristocracy in so far as a number of persons are set in authority partly democra-  
tie government by the people in so far as the rulers can be chosen from the people and the people have the right to choose their rulers. In such a system the monarchical principle is blended with aristocratic and democratic elements to whatever extent the nobles and the commons play a part in the government. But neither group functions politically as citizens do under purely constitutional government.

The question of constitutional justice can however be carried over from ancient to modern times. Modern democracy answers it differently granting equality to all men on the basis of their being born human. It recognizes no wealth or breeding no basis for special political preference or privilege. By these standards the mixed constitution and even the most extreme form of Greek democracy must be regarded as oligarchical in character by a writer like Mill.

Yet Mill no less than Aristotle would agree with Montesquieu's theory that the rightness of any form of government must be considered with reference to the humor and disposition of the people in whose favor it is established. The constitution and laws Montesquieu writes should be adapted in such a manner to the people for whom they are framed that it would be a great chance if those of one nation subdue another.

Mill makes the same point somewhat differently when he says the ideally best form of government does not mean one which is practicable or eligible in all states of civilization. But although he is willing to consider the form of government in relation to the historic conditions of a people not simply by absolute standard Mill differs sharply from Montesquieu and Aristotle in one very important respect. For him as we have seen representative democracy founded on universal suffrage is absolutely speaking the only truly democratic government—the only perfectly suited

to the nature of man. Peoples whose accidental circumstances temporarily justify less just or even unjust forms of government such as oligarchy or despotism must not be forever condemned to subjection or disfranchisement but should rather be raised by education experience and economic reforms to a condition in which the ideal polity becomes appropriate for them.

**THE BASIC PROBLEMS OF DEMOCRATIC GOVERNMENT**—seen from the point of view of those who either attack or defend it—remain constant despite the altered conception of democracy in various epochs.

At all times there is the question of leadership and the need for obtaining the political services of the best men without infringing on the political prerogatives of all men. The difference between the many and the few between the equality of men as free or human and their individual inequality in virtue or talent must always be given political recognition if not by superiority in status then by allocation of the technically difficult problems of statecraft to the expert or specially competent will only certain broad general policies left to the determination of a majority vote. Jefferson and Mill alike hope that popular government may abolish privileged classes without losing the benefits of leadership by peculiarly gifted individuals. The realization of that hope Jefferson writes Adams depends on leaving to the citizens the free election and separation of the aristos from the pseudo aristos of the wheat from the chaff.

At all times there is the danger of tyranny by the majority and under the threat of revolution the rise of a demagogue who uses mob rule to establish a dictatorship. Hobbes phrases this peculiar susceptibility of democracy to the mischief of demagogues by saying of popular assemblies that they are as subject to evil counsel and to be seduced by orators as a monarch by flatterers with the result that democracy tends to degenerate into government by the most powerful orator.

The democratic state has seldom been tempted to undertake the burdens of empire without suffering from discordance between its domestic and its foreign policy. Again and again

Thucydides describes the efforts of the Athenians to reconcile their imperialism abroad with democracy at home

In his oration at the end of the first year of the Peloponnesian war Pericles praises the democracy of Athens and at the same time celebrates the might of her empire. It is only the Athenians he says who fearless of consequences confer their benefits not from calculations of expediency but in the confidence of liberality. But four years later after the revolt of Mitylene Cleon speaks in a dissentient vein. Thucydides describes him as being at that time by far the most powerful with the commons. He tells his fellow citizens of democratic Athens that he has often before now been convinced that a democracy is incapable of empire but never more so than by your present change of mind in the matter of Mitylene. He urges them to return to their earlier decision to punish the Mitylenians for he says if they reverse that decision they will be giving way to the three failings most fatal to empire — pity, sentiment and indulgence.

Diodotus who in this debate recommends a policy of leniency does not do so in the confidence of liberality which Pericles had said was the attitude of a democratic state toward its dependencies. The question is not of justice. Diodotus declares but how to make the Mitylenians useful to Athens. We must not sit as strict judges of the offenders to our own prejudice but rather see how by moderate chastisements we may be enabled to benefit in the future by the revenue producing powers of our dependencies. It is far more useful for the preservation of our empire he concludes voluntarily to put up with injustice than to put to death however justly those whom it is our interest to keep alive.

Twelve years later Alcibiades no democrat himself urges the Athenians to undertake the Sicilian expedition by saying we cannot fix the exact point at which our empire shall stop we have reached a position in which we must not be content with retaining but must scheme

to extend it for if we cease to rule others we are in danger of being ruled ourselves. In the diplomatic skirmishes which precede the invasion of Sicily Hermocrates of Syracuse tries to unite the Sicilian cities so that they may escape disgraceful submission to an Athenian master. The Athenian ambassador Euphemus finds himself compelled to speak at first of our empire and of the good right we have to it but he soon finds himself frankly confessing that for tyrants and imperial cities nothing is unreasonable if expedient.

The denouement of the Peloponnesian war and especially of the Syracusan expedition is the collapse of democracy not through the loss of empire but as a result of the moral sickness involved in trying to maintain or increase it. Tacitus commenting on the decay of republican institutions with the extension of Roman conquests underlines the same theme. It is still the same theme when the problems of British imperialism appear in Mill's discussion of how a democracy should govern its colonies or dependencies.

The incompatibility of empire with democracy is one side of the picture of the democratic state in external affairs. The other side is the tension between democratic institutions and military power or policy — in the form of standing armies and warlike maneuvers. The efficiency traditionally attributed to democracy under peaceful conditions does not from all the evidences of history seem to render democracy weak or pusillanimous in the face of aggression.

The deeper peril for democracy seems to lie in the effect of war upon its institutions and on the morality of its people. As Hamilton writes in *The Federalist* "The violent destruction of life and property incident to war the continual effort and alarm attendant on a state of continual danger will compel nations the most attached to liberty to resort for repose and security to institutions which have a tendency to destroy their civil and political rights. To be more safe they at length become willing to run the risk of being less free."

## OUTLINE OF TOPICS

1 Conceptions of democracy the comparison of democracy with other forms of government	312
2a The derogation of democracy the anarchic tendency of freedom and equality	313
2b Lawless mob-rule the tyranny of the majority	
2c The incompetence of the people and the need for leadership the superiority of monarchy and aristocracy	
3 The acceptance of democracy as one of several good forms of government	314
3a Comparison of democratic and oligarchic justice the mixed constitution as a compromise between the interests of the poor and rich	
3b Comparison of the political wisdom of the many and the few the mixed regime as including both	
3c Comparison of democracy aristocracy and monarchy with respect to efficiency	315
4 The praise of democracy the ideal state	
4a Liberty and equality for all under law	
(1) Universal suffrage the abolition of privileged classes	
(2) The problem of economic justice the choice between capitalism and socialism	316
4b The democratic realization of popular sovereignty the safeguarding of natural rights	
4c The infirmities of democracy in practice and the reforms or remedies for these defects	
4d The suitability of democratic constitutions in all men under all circumstances conditions favorable to democracy progress toward democracy	317
5 Democracy and representative government	
5a The distinction between direct democracy and representative or republican government the territorial limits of democracy	
5b The theory of representation	
(1) Majority rule and minority or proportional representation	
(2) Ultimate limitations on the franchise	
(3) Methods of election and voting	
(4) The role of political parties factions	318
5c The distribution of functions and powers checks and balances in representative democracy	
6 The educational task of democracy the training of all citizens	319
7 The growth and vicissitudes of democracy	
7a Demagoguery and the danger of revolution	
7b The dangers of imperialism the treatment of dependencies	
7c The challenge of war and peace the citizen army	320

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad* BK II [26, 28] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 1.

**PAGE SECTIONS.** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters c and d refer to the upper and lower halves of the left hand side of the page the letters e and f to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS.** One or more of the main divisions of a work (such as PART BK CH. SECT.) are sometimes included in the reference line numbers, in brackets are given in certain cases e.g. *Iliad* BK II [26, 28] 12d

**BIBLE REFERENCES.** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e.g. OLD TESTAMENT *Nehemiah* 7:45—(D) *II Esdras* 7:46

**SYMBOLS.** The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

## *Chapter 17 DESIRE*

### INTRODUCTION

\ Darwin, Mill, James, and Freud at the modern end of the great tradition, the word *desire* primarily signifies a cause of animal and man behavior. It is one of the basic terms in behavioral analysis, covering that whole range of phenomena which are also referred to such terms as *wanting*, *needing*, *craving*, *wishing*, *desiring*, all of which are discussed in connection with theories of instinct and emotion, *fixes* and love motivation and purpose.

If we turn to traditional beginnings, to the *natures* of Plato, Aristotle, Galen and Plutarch, we find that the psychological consideration of desire is part of a much larger context. The ancients are of course concerned with those of desire in causing animal or human behavior and with the causes of such desire but they are also interested in *causes* which seem to be present in plants as well as animals. Plato, or *et cetera*, attributes to plants "feelings of pleasure and pain and the desires which accompany them. The vegetative acts *resulting* from basic appetites—or in modern terminology "biological needs"—inherent in *all* matter.

Because hunger and thirst so readily summarize the essence of desire (or certainly *receptivity*) its most general manifestation in living things, the words "appetite" and "desire" are frequently used as synonymous in the earlier phase of the tradition. As Hobbes observes, he prefers to use "appetite" and "desire" as synonyms, desire is the general name" and appetite is oftentimes res saved to signify the desire for food, namely hunger and thirst." So, too, Spinoza says that "there is no difference between appetite and desire" yet he adds, "or 'as in this particular that desire is general, related to men in so far as they are conscious of their appetites, and it may therefore

be defined as appetite of which we are conscious."

Spinoza here seems to be reflecting the distinction made by earlier writers between natural appetite and conscious desire which we today would perhaps express in terms of "need" and "wish." The ancient conception of tendencies inherent in all things—inanimate as well as living—which seek a natural fulfillment broadens the meaning of appetite or desire. When Aristotle says that "each thing seeks its own perfection" and that "nature does nothing in vain," he is thinking of non-living as well as living bodies. Wherever in the physical world there seem to have a natural tendency to move in a certain direction or to change in a certain way, there appetite belonging to the very nature of the moving thing operates as a cause. Adopting this view Dante declares that "neither Creator nor creature was ever without love either natural or of the mind and in his *Commedia* he shows how each thing has its specific love. The love, or desire of the elements is their innate affinity to their proper place" minerals desir "the place where their generation is ordained" with the result that "the world ever receives power from the direction of its generation."

According to this view it is possible to speak of the natural desire of raindrops to fall or of smoke to rise. Such a manner of speaking may at first seem metaphorical—an expression of primitive animism or anthropomorphism—but the ancients, observing different natural tendencies in heavy and light bodies, meant this literally.

The sense of such statements is no different from what is meant when it is said that the sunflower without consciousness naturally tends to turn toward the sun, or that all men by nature desire to know.

FROM ITS NARROWEST meaning with reference to the behavior of animals and men desire gains a wider connotation when it is conceived as covering the appetites found in living organisms. But in its broadest significance it refers to the innate tendency inherent in matter itself. As we shall presently see appetite, desire or tendency is seated in matter according to that conception of matter which identifies it with potentiality or potential being. These considerations are more fully treated in the chapters on BEING, CHANGE and MATTER but their significance for the notion of desire can be briefly indicated here.

Plotinus suggests the basic insight when he describes matter as "in beggary striving as it were by violence to acquire and always disappointed." Matter is that in natural things which is the reason for their motion and change. Considering natural change Aristotle names what he thinks are its three principles. In addition to something divine good and desirable he writes "we hold that there are two other principles the one contrary to it the other such as of its own nature to desire and yearn for it." These are respectively form privation and matter. The relation between matter and form is expressed by Aristotle in terms of desire:

The form cannot desire itself he says for it is not defective nor can the contrary desire it for contraries are mutually destructive. The truth is that what desires the form is matter as the female desires the male.

Conceived most generally as natural appetite or tendency desire becomes a physical or metaphysical term. *Natural appetite* says Aquinas is that inclination which each thing has of its own nature. The significance of desire in this sense extends far beyond psychological phenomena to all things in motion under the impetus or inclination of their own natures rather than moved violently by forces impressed on them from without.

In ancient physics every natural tendency has an end or fulfillment in which the motion governed by that tendency comes to rest. *Eros* and *telos*—desire and end—are complementary concepts each implying the other as principles of physics i.e. as factors operating together throughout nature in the order of change. The *telos* of each thing is the perfection which satis-

fies the tendency of its nature. That *telos* does nothing in vain means simply that no natural desire—need or appetite—exists without the possibility of fulfillment.

**CONSIDERING THE DESIGN** of the universe and the relation of creatures to God theologians, Augustine and Aquinas use the concept of desire in both its psychological and its metaphysical sense.

Considered metaphysically desire can be present only in finite beings for to be finite to be in want of some perfection. Hence desire can in no way enter into the immutable infinite and perfect being of God. In desire Aquinas points out a certain imperfection implied namely the lack of the good which we have not. Since God is perfect desire can not be attributed to Him except metaphorically. Love however implies perfection rather than imperfection since it flows from the act of the will to diffuse its own goodness among others. For that reason although the infinite perfection of God precludes desire it does not preclude love.

The theologian goes beyond the metaphysician or physicist when he carries the analysis of desire to the supernatural plane. As God is the supernatural efficient cause of all created things so God is also the supernatural final cause—the end or ultimate good toward which all creatures tend. The metaphysical maxim that each thing seeks its own perfection is then transformed

All things Aquinas writes by desire their own perfection desire God Himself as much as the perfections of all things are to many similitudes of the divine being. Of those things which desire God some know Him as He is Himself and this is proper to the rational creature others know some participation of His goodness and this belongs also to sensible knowledge others have a natural desire without knowledge as being directed to their end by a higher intelligence.

The existence in the creature of a desire for God raises difficult questions concerning the manner in which this desire is fulfilled. A supernatural end cannot be attained by purely natural means i.e. without God's help. The *telos* of God in which the souls of the blessed come to rest is according to the theologian the ult-

are, it of grace. Hence in man's case at least becomes necessary to ask whether he can have a purely natural desire to see God if the goal such desire cannot be achieved by purely natural means.

The question is not whether men to whom God has revealed the promise of ultimate glory can naturally desire the beatific vision. Clearly that is possible though to sustain such desire the theological virtue of hope inseparable from faith and charity may be required. Rather the question is whether the beatific vision which is an supernatural end can be the object of natural desire. On this the theologians appear to be less clearly decided.

Aquinas holds that "neither man nor any creature can attain final happiness by his natural powers." Yet he also seems to maintain that man has a natural desire for the perfect happiness of eternal life. The object of the will, i.e., of man's appetite, he writes, is the natural good just as the object of the intellect is the natural truth. Man's natural desire to know the truth—not just some truths but the whole truth, the infinite truth—would seem to require the vision of God for its fulfillment. Aquinas argues similarly from the will's natural desire for the infinite good. Daught an infallible man's will, he writes, save the universal good to be found not in any creature but in God alone. Some writers find this confirmed in the fact that whatever good a man sets his heart upon he pursues to infinity. No infinite amount of pleasure or power or wealth seems to satiate him. He always wants more. But there is no end to wanting more of such things. The infinity of such desires must result in frustration. Only God says the theologian, only an infinite being can satisfy man's infinite longing for all the good there is.

See man's restlessness no matter where he turns to find rest. Augustine declares: "Thou madest us for Thyself and our heart is restless, until it repose in Thee." Pascal teaches the same conclusion when he considers the condition of men which results from the desperation of their unending search. Their error be cause it does not lie in seeking excitement if they seek it only as a diversion; the error is that they seek it as if the possession of the objects of the quest would make them really happy."

With regard to the frantic pursuit of diversions, he claims that both the censors and the censured do not understand man's true nature and the misery of man without God. In such restlessness and vain seeking the theologian sees evidence of man's natural desire to be with God.

Admitting the same facts, the skeptic interprets the infinity of man's desire as a craving to be God. If this is not every man's desire it is certainly Satan's in *Paradise Lost*. Skeptic or believer every man understands the question which Goethe and Dante among the great poets make their central theme. At what moment amid man's yearning and restlessness will the soul gladly cry: "Ab longer o'er thou art so far?" Confident that there can be no such moment Faust makes that the basis of his wager with Mephistopheles.

The two poets appear to give opposite answers to the question. Faust finds succor in an earthly vision of progressive codes or Heavenly rest comes to the soul of Dante at the very moment it relinquishes its quest winning peace through succor.

In THE WIDEST OR THEOLOGICAL sense of the word God alone does not desire. In the narrowest or psychological sense only animals and men do. The contrast of meanings is useful. Natural appetite or tendency throws light on the nature of conscious desire.

In order to determine the nature and seat of desire, Socrates in the *Philebus* considers such things as hunger, thirst and the like as in the class of desires. He points out that when we say a man thirsts, we mean to say that he is empty. It is not drink he desires, but replenishment by drink, which is a change of state. This insight Socrates generalizes by saying that he who is empty desires the opposite of what he experiences for he is empty and desires to be full. In the *Symposium* using the words love and desire as if they were interchangeable, Socrates declares that "he who desires something is in want of something" and "love is of something which a man wants and has not."

In the psychological sphere desire and love are often identified—at least verbally. The one word is frequently substituted for the other. Here the fact already noted that God loves but

does not desire suggests the root of the distinction between desire and love. Desire always involves some lack or privation to be remedied by a change whereas love certainly requires the kind of satisfaction which abhors change. Love and desire are of course frequently mixed but this does not affect their essential difference as tendencies. They are as different as giving and getting. Love aims at the well-being of the beloved while desire seeks to enjoy a pleasure or possess a good.

Not all writers however contrast the generosity of love with the acquisitiveness of desire. Locke for example finds self-interest and self-seeking in both. The meaning of love he observes is known to anyone who reflects upon the thought he has of the delight which any present or absent thing is apt to produce in him.

For when a man declares in autumn when he is eating them or in spring when there are none that he loves grapes it is no more but that the taste of grapes delights him. The meaning of desire is in Locke's opinion closely related. It consists in the uneasiness a man finds in himself upon the absence of anything whose present enjoyment carries the idea of delight with it. We desire in short the things we love but do not possess.

The distinction between love and desire the question whether they are distinct in animals as well as in men and their relation to one another when they are distinct are matters more fully discussed in the chapter on *Love*. It is enough to observe here that when writers use the two words interchangeably they use both words to signify wanting and seeking.

In the case of animals and men the thing wanted is an object of conscious desire only if it is something known. In addition to being known as an object of science is known it must also be deemed good or pleasant—in other words worth having. For Locke desire as we have seen is no more than an uneasiness of the mind for want of some absent good which is measured in terms of pleasure and pain. What has an aptness to produce pleasure in us is that we call *good* and what is apt to produce pain in us we call *evil*. That which we consciously desire that which we judge to be desirable would thus be something regarded as good for us while the other would be that

which we seek to avoid as somehow injures rather than beneficial to us.

There is no question that desire and aversion are psychologically connected with estimates of good and evil or pleasure and pain. Thus the case no matter how we answer the moralist's question Do we desire something because it is good or do we call it good simply because we desire it? The ethical significance of the question and of the opposite answers to it is discussed in the chapter on *Good and Evil*.

**THE METAPHYSICAL** conception of nature & desire provides terms for the psychological analysis of conscious desire and its object. Viewed as belonging to the very nature of a that appetite according to Aristotle consists in the tendency toward something we do not have and which we need. Both factors are essential—the privation and the capacity or potentiality for having what is lacked. Privation in the strict sense is always correlative to potentiality.

The writers who use these terms would not speak of the sunflower being deprived of freedom even as they would not call a stone blind. Blindness is the deprivation of sight in things which have by nature a capacity to see. So when it is said that man by nature desires to know or that certain animals instinctively gregarious naturally tend to associate with one another in herds or societies the potentiality of knowledge or social life is indicated and precisely because of these potentialities ignorance and solitariness are considered privations.

We observe here two different conditions of appetite or desire. As the opposite of privation is possession—or of lacking having—so the opposite states of appetite are the drive toward the unpossessed and satisfaction in possession. We do not strive for that which we have until it be to retain our possession of it against loss and we do not feel satisfied until we get that which we have been seeking.

If a man being strong desired to be strong, says Socrates in the *Symposium*, or being swift desired to be swift or being healthy desired to be healthy, he might be thought to desire something which he already has or is. This would be a misconception which we must avoid. To one who says I desire to have simply what

ve Socrates thinks we should reply You friend having health and health and strength want to have the continuance of them. When you say I desire that which I like and nothing else is not your meaning at you want to have in the future what you now have? This is equivalent to saying that a man desires something which is for him non-existent and which he has not got from which Socrates draws the conclusion that everyone desires that which he has not already which is future and not present and of which he is now want.

The object of desire—natural or conscious—thus seems to be an altered condition in the desire the result of union with the object desired. Man's natural desire to know impels him to learn. Every act of learning which satisfies his natural desire consists in a changed condition of his mind a change which both Plato and Aristotle describe as a motion from ignorance to knowledge.

When we consciously desire food it is not an edible thing as such we seek but rather the thing of it. Only the eating of it will quiet our desire with that change in our condition we call nourishment. That the edible thing is only incidentally the object of our desire may be seen in the fact that no way in which we can possess food other than eating it satisfies hunger.

The distinction between natural and conscious desire is complicated by other closely related distinctions which psychologists have made. Freud for example distinguishes between conscious and unconscious desire. Darwin separates instinctive from learned desires and James observes how a conscious desire may become habitual and operate almost automatically without our awareness of either its object or its action.

Part of the complication is verbal and can be removed by referring to natural desires as non-conscious rather than unconscious. The word conscious literally means with knowledge. Creatures which lack the faculty of knowing cannot desire consciously. It does not follow however that sentient or conscious beings cannot have natural appetites. Man's natural desire to know is a case in point. That natural human tendency is not excluded by the fact

that many men also consciously seek knowledge knowing what knowledge is and considering it something worth having.

The instinctive desires of animals are not generally thought to operate apart from the perception of the object toward which the animal is emotionally impelled. The instinctive desire works consciously both on the side of perception and on the side of the emotionally felt impulse. If because it is innate rather than learned or acquired through experience we call the instinctive desire natural it is well to remember that we are not here using the word to signify lack of consciousness. Yet both instinctive and acquired desires may operate unconsciously.

What Freud means by a repressed desire illustrates this point. The repressed desire whether instinctual in origin or the result of some acquired fixation of the libido on object or ego would be a conscious tendency if it were not repressed. Freud compares the process of repression to the efforts of a man to get from one room to another past the guard of a door keeper. The excitations in the unconscious

to begin with, remain unconscious. When they have pressed forward to the threshold and been turned back by the door keeper they are incapable of becoming conscious we call them then repressed. Being repressed when applied to any single impulse means being unable to pass out of the unconscious system because of the door keeper's refusal of admittance into the preconscious.

The repressed desire is made to operate unconsciously by being repressed which does not prevent it from influencing our conduct or thought but only from intruding its driving force and its goal upon our attention. In contrast the desire which works habitually and therefore to some extent unconsciously is not repressed but merely one which no longer demands our full attention.

DESIRE AND EMOTION are often identified in our discussion of the behavior of animals and men. Sometimes however desire along with anger is treated as just one of the emotions and sometimes all the emotions are treated as manifestations of just one type of conscious appetite namely animal as opposed to rational desire.

does not desire suggests the root of the distinction between desire and love. Desire always involves some lack or privation to be remedied by a change whereas love certainly requires love implies the kind of satisfaction which abhors change. Love and desire are of course frequently mixed but this does not affect their essential difference as tendencies. They are as different as giving and getting. Love aims at the well being of the beloved while desire seeks to enjoy a pleasure or possess a good.

Not all writers however contrast the generosity of love with the acquisitiveness of desire. Locke for example finds self interest and self seeking in both. The meaning of love he observes is known to anyone who reflects upon the thought he has of the delight which any present or absent thing is apt to produce in him.

For when a man declares in autumn when he is eating them or in spring when there are none that he loves grapes it is no more but that the taste of grapes delights him. The meaning of desire is in Locke's opinion closely related. It consists in the uneasiness a man finds in himself upon the absence of anything whose present enjoyment carries the idea of delight with it. We desire in short the things we love but do not possess.

The distinction between love and desire the question whether they are distinct in animals as well as in men and their relation to one another when they are distinct are matters more fully discussed in the chapter on LOVE. It is enough to observe here that when writers use the two words interchangeably they use both words to signify wanting and seeking.

In the case of animals and men the thing wanted is an object of conscious desire only if it is something known. In addition to being known as an object of science is known it must also be deemed good or pleasant—in other words worth having. For Locke desire as we have seen is no more than an uneasiness of the mind for want of some absent good which is measured in terms of pleasure and pain. What has an aptness to produce pleasure in us is that we call *good* and what is apt to produce pain in us we call *evil*. That which we consciously desire that which we judge to be desirable would thus be something we regard as good for us while the bad or evil would be that

which we seek to avoid as somehow injurious rather than beneficial to us.

There is no question that desire and aversion are psychologically connected with estimates of good and evil or pleasure and pain. In the case no matter how we answer the Aristotelian question Do we desire something because it is good or do we call it good simply because we desire it? The ethical significance of the question and of the opposite answer is discussed in the chapter on GOOD AND EVIL.

**THE METAPHYSICAL** conception of natural desire provides terms for the psychological analysis of conscious desire and its object. He is belonging to the very nature of a vital appetite according to Aristotle consists in a tendency toward something we do not know and which we need. Both factors are essential—the privation and the capacity or potentiality for having what is lacked. Privation in the strict sense is always correlative to potentiality.

The writers who use these terms would not speak of the sunflower being deprived of freedom even as they would not call a stone blind. Blindness is the deprivation of sight in things which have by nature a capacity to see. So when it is said that man by nature desires to know or that certain animals instinctively gregarious naturally tend to associate with one another in herds or societies the potentiality of knowledge or social life is indicated and precisely because of these potentialities normality and solitariness are considered privations.

We observe here two different conditions of appetite or desire. As the opposite of privation is possession—or of lacking having—so the opposite states of appetite are the drive toward the unpossessed and satisfaction in possession. We do not strive for that which we have unless it be to retain our possession of it a amidst loss and we do not feel satisfied until we get that which we have been seeking.

If a man being strong desired to be strong says Socrates in the *Symposium* or being swift desired to be swift or being healthy desired to be healthy he might be thought to desire something which he already has or is. This would be a misconception which we must avoid. To any one who says I desire to have simply what

ital terms of psychoanalysis—conflict resolution or analysis or sublimation to name a few—carry the connotation of moral acts, even though they imply a purely psychological resolution of them.

Contrary to a popular misconception, Freud expressly declares that it is out of the question if part of the analytic treatment should consist of advice to live freely. The conflict between libidinal desires and sexual repression explains itself “not resolved by helping one to win a victory over the other. Although Freud thinks that what the world calls its code of morals demands more sacrifices than it worth, he also declares that “we must beware of overestimating the importance of abstinence in effecting neurosis.”

What Freud calls emotional infantilism resembles to some degree what a moralist like Aristotle calls self indulgence or incontinence. A great test to all the promptings of desire without regard to the demands of society or reality is to revert to infancy—a state characterized according to Freud by the irreconcilability of its wishes with reality. Because children live at the beck and call of appetites and it is in them that the desire for what is pleasant is strongest,” Aristotle thinks it fitting that we should speak of self indulgence when it occurs in an adult as a childish fault.

Aristotle and Freud seem to be looking at the same facts of human nature and seeing them in the same light. What Freud describes as the conflict between the “pleasure-principle” and the “reality principle” Aristotle—and with him Spinoza—treats as a conflict between the passions and the reason and habit courses in terms of the opposition between desire and duty. What Freud says of the reality principle—that it “demands and enforces the postponement of satisfaction, the renunciation of manifold possibilities, and the temporary endurance of pain”—parallels traditional moral statements concerning the role of reason or of duty in the moral life. Where the moralists speak of the necessity for regulating or moderating emotional desires, Freud refers to the need of do-

mesticating them, as one would train a beast to serve the ends of human life.

The implication in Aristotle as in Spinoza as well as in Freud does not seem to be that man’s animal appetites are in themselves bad but that if they are undisciplined or uncontrolled they cause disorder in the individual life and in society. Some moralists, however, take an opposite view. For them desire is intrinsically evil, a factor of discontent and fraught with pain.

“While what we crave is wanting” Lucretius writes, “it seems to transcend all the rest; then when it has been gotten, we crave something else”; yet as often as a man gains something new he discovers afresh that he is not better off. Either our desires are unsatisfied and then we suffer the agony of frustration or they are satisfied and so are we—desperate with ennui. Hence freedom from all desires, not just their moderation, seems to be recommended for peace of mind as centuries later Schopenhauer recommended the negation of the will to live in order to avoid frustration or boredom.

Marcus Aurelius and the Stoics, and later Kant similarly urge us not to yield to the persuasions of the body and never to be over-powered either by the motion of the senses or of the appetites. But whereas the Stoics would restrain desire because it is animal and in order to avoid pain Kant argues that the renunciation of desire should be undertaken not merely in accordance with duty but from duty which must be the true end of all moral cultivation.

The opposition between these two views of desire in the moral life represents one of the major issues in ethical theory further discussed in the chapters on Duty and Virtue. The doctrine of natural appetite is crucially relevant to the issue. If the naturalist in ethics is right he is so by virtue of the truth that natural tendencies are everywhere the measure of good and evil. If, however, there is no truth in the doctrine of natural desire then the impulses which spring from man’s animal passions can claim no authority in the court of reason.

The appropriate ordering a part of emotion is indicated by William James in his analysis of instinctive behavior. The functioning of an instinct may be viewed, according to James as a series of psychological events of "mental steps" called forth by determinate conditions which are in contact with the animal's body or at a distance in its environment, arousing "emotional excitations" which go with them. The emotional part of the instinctive behavior is shown as a impulse to perform certain acts and the feeling which accompanies the acts performed. The sheep instinctively recognizes the wolf as dangerous, fears and flees it never runs because it is afraid and feels fear in the act of flight. When we hear the theory of the instinctive James goes so far as to say that the feeling of fear results from running away. It does not mean to deny the other emotion of fear under the impulse to flee.

In its purest, simplest, or least-embellished form, emotion is a consciousness and by definition is accompanied by our sensations. The expression of emotion has been mainly expressed in the tradition of the great books. A person, for example, calls all the emotions of his soul "movements of the sentient spirit." But he also uses the words "desire" and "affection" along with "love" and "hate," "grief" and "joy" to mean special conditions

He also recognises the apparent "readiness" which a country has all the resources when it goes at these runs what he calls "readiness"—"there will be beginning of tension, & then the body of men, before it runs a race, so making, necessary trials, and other sensible action.

The eastern x" is now on to the "a lot at a  
ward something much or not, is called ap-  
peal x dense" Spores makes the air you  
is worn at different time "Dense" he  
x" "x we cover and x is part of a per-  
son who does not want to be known  
from other - and a determined and a  
active " is never a result of it is the  
or that very so want his desire very and the  
part of it the "dose from another just  
as the after from which each do "and de-  
fies There are a man kind of love, though  
for another or kinds from or no longer  
and a conductor as there are and of  
"I am not affected"

These preachers who find in man the  
driven & failures of knowledge, -th several  
the reasons & small or also find in him pro-  
found failures of appetite or desire. The de-  
finition is perhaps most largely made by the  
Dole and Agius who claim that "the term  
be our appetites tenacity & march is general  
& not which belongs to reason, a & not  
with a tendency toward the particular  
which appetite belongs to sense. The in-  
tellectual name for the intellectual appetite or the  
faculty of rational desire, is "will." In hymn  
vocabulary the term of desire & desire  
lated to the mind above is called will but when  
it is related at the same time both to the soul  
and the body is called appetite."

In the Auger's own opinion they do not consist of dreams, as there are silent sensations thought to be only faculty calls; and the "understanding," described as including the whole range of apparent phenomena according both to animal passiveness and acts of will. Hence for example, occurs the association of the sensations of "a musical radio" movement, and separate them from "a voluntary movement which, being done and in action beforehand are done with full precision of what they are to be." In order to draw a line between animalistic pulsions and acts of will, even though he does not distinguish in a positive formula.

\* also without the direction of fashion almost all others of lesser rank and consequence seem to agree upon a dress of a very simple style, at least so far as they are greater than the most expensive furniture in the house and the will. There was no such fully considered as the chapter on *Costume* and *Adress*.

Then & all is as it was before -- & I am still as I was before -- & the  
unconscious dream -- is as it was before -- & now produces no good and evil, & -- & I am  
not beginning that could give me trouble if  
I expected the same result again in my next  
incarnation, or that are easier than problems of  
this kind -- & I am still as I was before -- &  
the unconscious dream -- is as it was before -- &

mental terms of psychoanalysis—conflict regression rationalization sublimation to name only some—carry the connotation of moral issue, even though they imply a purely psychological resolution of them.

Contrary to a popular misconception Freud explicitly declares that it is out of the question that part of the analytic treatment should consist of advice to live freely. The conflict between libidinal desires and sexual repression he explains is not resolved by helping one side to win a victory over the other. Although Freud thinks that what the world calls its code of morals demands more sacrifices than it is worth, he also declares that we must beware of overestimating the importance of absence in effecting neurons.

What Freud calls emotional infantilism resembles to some degree what a moralist like Aristotle calls self indulgence or incontinence. To give vent to all the promptings of desire without regard to the demands of society or reality is to revert to infancy—a state characterized according to Freud by the irreconcilability of its wishes with reality. Because children live at the beck and call of appetite and it is in them that the desire for what is pleasant is strongest, Aristotle thinks it fitting that we should speak of self indulgence when it occurs in an adult as a childish fault.

Aristotle and Freud seem to be looking at the same facts of human nature and seeing them in the same light. What Freud describes as the conflict between the pleasure principle and the reality-principle Aristotle—and with him Spinoza—views as a conflict between the passions and the reason and Kant conceives in terms of the opposition between desire and duty. What Freud says of the reality principle—that it demands and enforces the postponement of satisfaction, the renunciation of manifold possibilities and the temporary endurance of pain—parallels traditional statements concerning the role of reason or of duty in the moral life. Where the moralists speak of the necessity for regulating or moderating emotional desires, Freud refers to the need of do-

mestication, them as one would train a beast to serve the ends of human life.

The implication in Aristotle and Spinoza as well as in Freud does not seem to be that man's animal appetites are in themselves bad but that if they are undisciplined or uncontrolled they cause disorder in the individual life and in society. Some moralists however take an opposite view. For them desire is intrinsically evil, a factor of discontent and fraught with pain.

While what we crave is wanting Lucretius writes, it seems to transcend all the rest; then when it has been gotten we crave something else, yet as often as a man gains something new he discovers afresh that he is not better off. Either our desires are unsatisfied and then we suffer the agony of frustration or they are satisfied and so are we—desperate with ennui. Hence freedom from all desires not just their moderation seems to be recommended for peace of mind as centuries later Schopenhauer recommended the negation of the will to live in order to avoid frustration or boredom.

Marcus Aurelius and the Stoics and later Kant similarly urge us not to yield to the persuasions of the body—and never to be over-powered entice by the motion of the senses or of the appetites. But whereas the Stoics would restrain desire because it is animal and in order to avoid pain Kant argues that the renunciation of desire should be undertaken not merely in accordance with duty—but from duty which must be the true end of all moral cultivation.

The opposition between these two views of desire in the moral life represents one of the major issues in ethical theory further discussed in the chapters on DUTY and VIRTUE. The doctrine of natural appetite is crucially relevant to the issue. If the naturalist in ethics is right he is so by virtue of the truth that natural tendencies are everywhere the measure of good and evil. If however there is no truth in the doctrine of natural desire then the impulses which spring from man's animal passions can claim no authority in the court of reason.

The appetitive or driving aspect of emotions is indicated by William James in his analysis of instinctive behavior. The functioning of an instinct may be viewed according to James as a train of psychological events of general reflex type called forth by determinate sensory stimuli in contact with the animal's body or at a distance in his environment arousing emotional excitements which go with them. The emotional part of the instinctive behavior is at once an impulse to perform certain acts and the feeling which accompanies the acts performed. The sheep instinctively recognizing the wolf as dangerous fears and flees. It runs away because it is afraid and feels fear in the act of flight. When in his theory of the emotions James goes so far as to say that the feeling of fear results from running away he does not mean to deny that the emotion of fear involves the impulse to flee.

In its aspect as impulse—or tendency to act—an emotion is a desire consciously aroused by sense-perceptions and accompanied by conscious feelings. This conception of emotion has been variously expressed in the tradition of the great books. Aquinas for example, calls all the emotions or passions movements of the sensitive appetite. But he also uses the words desire and aversion along with love and hate, anger and fear to name specific emotions.

Hobbes recognizes the appetitive tendency which is common to all the emotions when he finds at their root what he calls endeavor—those small beginnings of motion within the body of man before they appear in walking, speaking, striking and other visible actions.

This endeavor' he goes on to say when it is toward something which causes it is called appetite or desire. Spinoza makes the same point in somewhat different terms. Desire he writes is the essence itself or nature of a person in so far as this nature is conceived from its given constitution as determined towards any action.

As his nature is constituted in this or that way so must his desire vary and the nature of one desire differ from another just as the affects from which each desire arises differ. There are as many kinds of desire therefore as there are kinds of joy, sorrow, love, etc. and in consequence as there are kinds of objects by which we are affected.

Those psychologists who find in man two distinct faculties of knowledge—the senses and the reason or intellect—also find in him two distinct faculties of appetite or desire. The distinction is perhaps most sharply made by Aristotle and Aquinas who claim that there must be one appetite tending towards the universal good which belongs to reason and another with a tendency towards the particular good which appetite belongs to sense. The traditional name for the intellectual appetite or the faculty of rational desire is will. In Spinoza's vocabulary, the effort of desire when it is related to the mind alone is called will but when it is related at the same time both to the mind and the body is called appetite.

Psychologists who attribute these diverse modes of desire as they attribute sensation and thought to a single faculty called mind or understanding nevertheless deal with the whole range of appetitive phenomena including both the animal passions and act of will. James for example treats the instinctive acts associated with the emotions as automatic and reflex movements and separates them from voluntary movements which being desired and intended beforehand are done with full provision of what they are to be. In so doing he draws a line between emotional impulses and acts of will even though he does not distinguish two appetitive faculties.

With or without the distinction in faculties almost all observers of human experience and conduct seem to agree upon a distinction in types of conscious desire at least insofar as they recognize the ever present conflict between the passions and the will. These matters are more fully considered in the chapters on Emotion and Will.

THE ROLE OF DESIRE IN HUMAN LIFE—especially emotional desire—is so intimately connected with problems of good and evil, virtue, duty and happiness that until quite recently the subject was discussed mainly in books on ethics, politics or rhetoric rather than psychology. Even Freud who tries to separate psychological description and explanation from moral principles or conclusions cannot avoid treating the effects of morality upon the dynamics of desire and the life of the passions. Many of the funda-

mental terms of psychoanalysis—conflict repression rat oralization sublimation to name one some—carry the connotation of moral issues even though they imply a purely psychological resolution of them.

Contrary to a popular misconception Freud expressly declares that it is out of the question that part of the analytic treatment should consist of advice to live freely. The conflict between libidinal desires and sexual repression he explains is not resolved by helping one side to win a victory over the other. Although Freud thinks that what the world calls its code of morals demands more sacrifices than it is worth he also declares that we must beware of overestimating the importance of abstinence in effecting neurosis.

To give vent to all the promptings of desire without regard to the demands of society or reality is to revert to infancy—a state characterized according to Freud by the irreconcilability of its wishes with reality. Because children live at the beck and call of appetite and it is in them that the desire for what is pleasant is strongest Aristotle thinks it fitting that we should speak of self indulgence when it occurs in an adult as a childish fault.

Aristotle and Freud seem to be looking at the same facts of human nature and seeing them in the same light. What Freud describes as the conflict between the pleasure principle and the reality principle Aristotle—and with him Spinoza—treats as a conflict between the passions and the reason and Kant conceives in terms of the opposition between desire and duty. What Freud says of the reality principle—that it demands and reinforces the postponement of satisfaction on the renunciation of manifold possibilities and the temporary endurance of pain—parallels traditional statements concerning the role of reason or of duty in the moral life. Where the moralists speak of the necessity for regulating or moderating normal desires Freud refers to the need of do-

mesticating them as one would train a beast to serve the ends of human life.

The implication in Aristotle and Spinoza as well as in Freud does not seem to be that man's animal appetites are in themselves bad but that if they are undisciplined or uncontrolled they cause disorder in the individual life and in society. Some moralists, however, take an opposite view. For them desire is intrinsically evil, a factor of discontent and fraught with pain.

While what we crave is wanting Lucretius writes it seems to transcend all the rest then when it has been gotten we crave something else yet as often as a man gains something new he discovers afresh that he is not better off. In Spinoza's vocabulary the effort of desire when it is related to the mind alone is called will but when it is related at the same time both to the mind and the body is called appetite.

Psychologists who attribute these diverse modes of desire as they attribute sensation and thought to a single faculty called mind or understanding nevertheless deal with the whole range of appetitive phenomena including both the animal passions and act of will. James for example treats the instinctive acts associated with the emotions as automatic and reflex movements and separates them from voluntary movements which being desired and intended beforehand are done with full pre-vision of what they are to be. In so doing he draws a line between emotional impulses and acts of will even though he does not distinguish two appetitive faculties.

With or without the distinction in faculties almost all observers of human experience and conduct seem to agree upon a distinction in types of conscious desire at least insofar as they recognize the ever present conflict between the passions and the will. These matters are more fully considered in the chapters on Emotion and Will.

THE ROLE OF DESIRE in human life—especially emotional desire—is so intimately connected with problems of good and evil, virtue, duty and happiness that until quite recently the subject was discussed mainly in books on ethics, politics or rhetoric rather than psychology. Even Freud who tries to separate psychological description and explanation from moral principles or conclusions cannot avoid treating the effects of morality upon the dynamics of desire and the life of the passions. Many of the funda-

mental terms of psychoanalysis—conflict repression or oralization/sublimation to name only some—carry the connotation of moral issues, even though they imply a purely psychological resolution of them.

Contrary to a popular misconception Freud expressly declares that it is out of the question that part of the analytic treatment should consist of advice to live freely. The conflict between libidinal desires and sexual repression he explains is not resolved by helping one side to win a victory over the other. Although Freud thinks that what the world calls its code of morals demands more sacrifices than it is worth, he also declares that we must beware of overestimating the importance of absence in effecting neurosis.

What Freud calls emotional infantilism resembles to some degree what a moralist like Aristotle calls self indulgence or incontinence. To give vent to all the promptings of desire without regard to the demands of society or reality is to revert to infancy—a state characterized according to Freud by the irreconcilability of its wishes with reality. Because children live at the beck and call of appetite and it is in them that the desire for what is pleasant is strongest, Aristotle thinks it fitting that we should speak of self indulgence when it occurs in an adult as a child's fault.

Aristotle and Freud seem to be looking at the same facts of human nature and seeing them in the same light. What Freud describes as the conflict between the pleasure-principle and the reality principle Aristotle—and with him Spinoza—treats as a conflict between the passions and the reason and how he conceives in terms of the opposition between desire and duty. What Freud says of the reality principle—that it demands and enforces the postponement of satisfaction, the renunciation of manifold possibilities, and the temporary endurance of pain—is parallel, traditional statements concerning the role of reason or of duty in the moral life. Where the moralists speak of the necessity of regulating or moderating emotional desires, Freud refers to the need of do-

mesticating them as one would train a beast to serve the ends of human life.

The implication in Aristotle and Spinoza as well as in Freud does not seem to be that man's animal appetites are in themselves bad, but that if they are undisciplined or uncontrolled they cause disorder in the individual life and in society. Some moralists, however, take an opposite view. For them desire is intrinsically evil, a factor of discontent and fraught with pain.

While what we crave is wanting, Lucretius writes, it seems to transcend all the rest; then when it has been gotten we crave something else; yet as often as a man gains something new he discovers afresh that he is not better off. Either our desires are unsatisfied and then we suffer the agony of frustration or they are satisfied and so are we—desperate with ennui. Hence freedom from all desires, not just their moderation, seems to be recommended for peace of mind ascent; later Schopenhauer recommended the negation of the will to live in order to avoid frustration or boredom.

Marcus Aurelius and the Stoics, and later Kant similarly urge us not to yield to the persuasions of the body and never to be overpowered either by the motion of the senses or of the appetites. But whereas the Stoics would restrain desire because it is animal and in order to avoid pain, Kant argues that the renunciation of desire should be undertaken not merely in accordance with duty but from duty which must be the true end of all moral cultivation.

The opposition between these two views of desire in the moral life represents one of the major issues in ethical theory further discussed in the chapters on DUTY and VIRTUE. The doctrine of natural appetite is crucially relevant to the issue. If the naturalist in ethics is right, he is so by virtue of the truth that natural tendencies are everywhere the measure of good and evil. If however there is no truth in the doctrine of natural desire, then the impulses which spring from man's animal passions can claim no authority in the court of reason.

## OUTLINE OF TOPICS

	PAGE
1 Desire and the order of change <i>eros and telos</i>	331
2 The analysis of desire or appetite	332
2a The roots of desire in need privation or potency the instinctual sources of the libido	332
2b The objects of desire the good and the pleasant	333
2c Desire as a cause of action motivation or purpose voluntariness	333
2d The satisfaction of desire possession and enjoyment	334
3 The modes of desire or appetite	
3a Natural appetite desires determined by nature or instinct	335
3b Desires determined by knowledge or judgment	335
(1) The distinction between sensitive and rational desire emotional tendencies and acts of the will	335
(2) Conscious and unconscious desires habitual desire	336
3c Desire and love their distinction and connection	336
3d Desire and aversion as emotional opposites	337
4 The economy of desire in human life	
4a The conflict of desires with one another	338
4b The attachment of desires fixations projections identifications transferences	338
4c The focusing of desires emotional complexes	338
4d The discharge of desires catharsis and sublimation	338
5 Desire as ruler	
5a Desire ruling imagination daydreaming and fantasy	339
5b Desire ruling thought rationalization and wishful thinking	339
5c Desire ruling action the unchecked expression of desires incontinence	339
6 Desire as subject to rule	340
6a The regulation of desire by reason the discipline of moral virtue or duty	340
6b The restraint or renunciation of desire abstention inhibition repression	341
6c The results of repression dreaming symbolic over reactions neuroses	341
7 Desire and infinity	
7a The infinite tendency of desires	341
(1) The pursuit of pleasure	341
(2) The lust for power	341
(3) The accumulation of wealth	341
7b The restless search for the infinite the desire for the vision of God	343

## REFERENCES

To find the passus as cited, use the numbers in **heavy type**, which are the volume and page numbers of the passus referred to. For example, in **4 Hoc e fluid ex illi 6, §312d**, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

**P or Secno.** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 33 folio 3 *Pratol* 91 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 *Pl. ro Stpo* 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

**AUTHOR'S DISCUSSION** On 6 more of the main discussions of a work (such as *PLATE*, *CHART*, etc.) are sometimes included in the reference line numbers, in brackets, are given in certain cases e.g. *PLATE 116, FIG. 12d.*

B 1 R 1 & 23 The references are to book, chapter and verse. When the King James and Douay version differ in title of book or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows eg Old Test & New Testament, 45-(D) II Esdras, 46

Six. The *bb* evocation "exp call th reader attention to one o m re especially relevant parts f whole sentence passim signifies that the topic discussed interests tend rather than co unusually in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of The Great Ideas; consult the Preface.

# Chapter 18 DIALECTIC

## INTRODUCTION

THE words "dialectical" and "dialectician" are currently used more often in a derogatory than in a descriptive sense. The person who criticizes an argument by saying, "It's just a matter of definition" is also apt to say, "That may be true dialectically but . . ." or "You're just being dialectical." Implied in such remarks is dispraise of reasoning which however excellent or skillful it may be as reasoning stands condemned for being out of touch with fact or experience.

Still other complaints against dialectic are that it plays with words, begs the question, makes sport of contradiction. When the theologian Hippothadeus almost convinces Panurge that he "should rather choose to marry once than to burn still in fires of concupiscence," Rabelais has Panurge raise one last doubt against the proposal. Shall I be a cuckold? he asks. "Yes or no?" Hippothadeus answers. By no means will you be a cuckold, if it please God. On receiving this reply Panurge cries out: O the Lord help us now whether are we driven to, good folks? To the conditionals, which according to the rules and precepts of the dialectic faculty admit of all contradiction and impossibilities. If my Transalpine mule had wings, my Transalpine mule would fly. If it please God I shall not be a cuckold but I shall be a cuckold if it please him.

As a term of disapproval "dialectical" has been used by scientists against philosophers, by philosophers against theologians and with equal intent by religious men against those who resort to argument concerning matters of faith.

The early Middle Ages witnessed a conflict between the material and the rational approaches to the truths of religion. Those for whom religious experience and revelation were

the only avenue to God condemned the dialecticians—the philosophers or theologians who tried to use reason discursively rather than proceed by intuition and vision. With the Reformation and with the Renaissance men like Martin Luther and Francis Bacon regarded dialectic as the bane of mediaeval learning. Because of its dialectical character Luther dismissed all theological speculation as sophistry. Bacon for the same reason stigmatized scholastic philosophy as consisting in "no great quantity of matter and infinite agitation of wit."

On grounds which were common as well as opposite both mystics and experimentalists attacked dialectic as a futile if not vicious use of the mind—as hair-splitting and logic-chopping. Even when they admitted that it might have some virtue they approved of it as a method of argument or proof proper enough perhaps in forensic oratory or political debate but entirely out of place in the pursuit of truth or in approaching beauty.

A CERTAIN CONCEPTION of dialectic is implicit in all such criticisms. The dialectician is a man who argues rather than observes, who appeals to reason rather than experience, who draws implications from whatever is said or can be said pushing a premise to its logical conclusion or reducing it to absurdity. This aspect of dialectic appears to be the object of Rabelais' satire in the famous dispute between Panurge and Thaumaturgus which is carried on by signs only without speaking, for the matters are so abstruse, hard and arduous, that words proceed from the mouth of man will never be sufficient for the unfolding of them.

In view of those who think that truth can be learned only by observation, by induction from particulars, or generalization from experience the technique of dialectic far from being a

## ADDITIONAL READINGS

Listed below are works not included in *Creat Books of the Western World* but relevant to the idea and topics with which this chapter deals. These works are divided into two groups:

- I Works by authors represented in this collection
- II Works by authors not represented in this collection

- adds I am a man and the other has given his assent to this also the first dia is his conclusion Then you are not a man

According to Augustine this sort of reasoning argument should not be called dialectical but sophistical If makes the same sort of observation about the abuse of rhetoric in speech which only a master verbal ornamentation more than that is consistent with seriousness of purpose That too he thinks should be called sophistical in order to avoid attaching the name of rhetoric to misapplications of the art

Dialectic for Augustine is the art which deals with inferences and definitions and divisions and is of the greatest assistance in the discovery of meaning Rhetoric on the other hand, is not to be used so much for a certain in the meaning as for setting forth the mean in when it is ascertained Dialectic in other words is divorced from the practical purpose of stating and winning an argument and given theoretical status as a method of inquiry

This conception of dialectic originates in the dialogues of Plato Not himself a sophist either by profession or in aim Socrates found other uses for the analytical and argumentative device invented by the sophists The same skills of mind which were practically useful in the public assembly and in the law courts could be used or adapted for clarification and precision in speculative discussions They could also be used to find the truth implicit in the commonly expressed convictions of men and to lay bare errors caused by lack of definition in discourse or lack of rigor in reasoning

In the Republic Plato separates the philosopher from the sophist not by any distinction in method but by the difference in the use each makes of the same technique And in the Republic on of the reasons Socrates gives for postponing the study of dialectic until the age of thirty is that youngsters when they first get the taste in their mouth argue for amusement and like puppy dogs they rejoice in pulling and tearing talk to come near them as a result of being vainly disputatious they get into the way of not believing anything which they believed before and hence not only they but philosophy and all that relates

to it is apt to have a bad name with the rest of the world But when a man begins to get older he will no longer be guilty of such insanity he will imitate the dialectician who is seeking for truth and not the sophist who is contradicting for the sake of amusement

In the hands of the philosopher dialectic is an instrument of science There is according to Socrates no other method of comprehending by any regular process all true existence or of ascertaining what each thing is in its own nature It passes beyond the arts at the lowest level which are concerned with the desires or opinions of men or are cultivated with a view to production and construction It likewise transcends the mathematical sciences which while they have some apprehension of true being leave the hypotheses which they use unexamined and are unable to give an account of them Using these as handmaids and helpers dialectic goes directly to the first principle and is the only science which does away with hypotheses in order to make her ground secure

The dialectic of Plato has an upward and a downward path which somewhat resemble the inductive process of the mind from facts to principles and the deductive process from principles to the conclusions they validate Dialectic says Socrates ascends by using hypotheses as steps and points of departure into a world which is above hypotheses in order that she may soar beyond them to the first principle of the whole By successive steps she descends again without the aid of any sensible object from ideas through ideas and in ideas she ends

As thus explained search for truth dialectic includes all of logic It is concerned with every phase of thought with the establishment of definition the examination of hypotheses in the light of their presuppositions or consequences the formulation of inferences and proofs the resolution of difficulties arising from opposition in thought

WHEREAS FOR PLATO dialectic is more than the whole of logic for Aristotle it is less Dialectic is more than the process by which the mind goes from myth and fantasy perception and opinion, to the highest truth For Plato it is the

method of inquiry seems to have virtue only for the purpose of disputation or criticism

The human faculties writes Gibbon are fortified by the art and practice of dialectics It is the keenest weapon of dispute he adds but more effectual for the detection of error than for the investigation of truth

Mill describes the Socratic dialectics so magnificently exemplified in the dialogues of Plato as a contrivance for making the difficulties of the question present to the learner's consciousness They were essentially a negative discussion of the great questions of philosophy and life he continues directed with consummate skill to the purpose of convincing anyone who has merely adopted the commonplaces of received opinion that he did not understand the subject The school disputations of the Middle Ages had a somewhat similar object In Mill's opinion as a discipline to the mind they were in every respect inferior to the powerful dialectics which formed the intellects of the Socratic viri but the modern mind he says owes far more to both than it is generally willing to admit and the present modes of education contain nothing which in the smallest degree supplies the place either of the one or of the other

Disparaging comment on dialectic comes not only from those who contrast it unfavorably with the methods of experiment or empirical research It is made also by writers who trust reason's power to grasp truths intuitively and to develop their consequences deductively Sensitive to what may seem to be a paradox here Descartes writes in his *Rules for the Direction of the Mind* It may perhaps strike some with surprise that here where we are discussing how to improve our power of deducing one truth from another we have omitted all the precepts of the dialecticians The dialectician can proceed only after he has been given premises to work from Since in Descartes view dialectic provides no method for establishing premises or for discovering first principles it can contribute nothing at all to the discovery of the truth Its only possible use is to serve to explain at times more easily to others the truths we have already ascertained hence it should be transferred from Philosophy to Rhetoric

THE CONNECTION of dialectic with disputation and rhetoric has some foundation in the historical fact that many of the techniques of dialectic originated with the Greek sophists who had primarily a rhetorical or forensic aim Comparable to the Roman rhetoricians and to the law teachers of a later age the sophists taught young men how to plead a case how to defend themselves against attack how to persuade an audience Skill in argument had for them a practical not a theoretical purpose not truth or knowledge but success in litigation or in political controversy The familiar charge that the method they taught enabled men to make the worse appear the better reason probably exaggerates but none the less reflects the difference between the standards of probability in disputation and the standards of truth in scientific inquiry This has some bearing on the disrepute of sophistry and the derogatory light cast on the dialectical when it is identified with the *sophistical*

But there is another historical fact which places dialectic in a different light In the tradition of the liberal arts especially in their Roman and mediaeval development dialectic and logic are interchangeable names for the discipline which together with grammar and rhetoric comprises the three liberal arts known as the trivium In his treatise *On Christian Doctrine* Augustine uses the word dialectic in this way Whatever else it means the identification of dialectic with logic implies its distinction from rhetoric and certainly from sophistry

Yet Augustine does not fail to observe the misuse of dialectic which debases it to the level of sophistry In the use of it he declares we must guard against the love of wrangling and the childish vanity of entrapping an adversary For there are many of what are called sophisms he continues inferences in reasoning that are false and yet so close an imitation of the true as to deceive not only dull people but clever men too when they are not on their guard He gives as an example the case of one man saying to another What I am you are not The other man may assent to this thinking as Augustine points out that the proposition is in part true the one man being cunning the other simple But when the first speaker

an oration of the universal and universalized exercise of the understanding.

When it is thus misused, the exercise of the pure understanding becomes dialectical. The second part of our transcendental logic, Kant writes, "must therefore be a critique of dialectical illusion and this critique we shall term Transcendental Dialectic—not meaning it as an art of producing dogmatically such illusion (an art which is unfortunately too current among the practitioners of metaphysical juggling) but as a critique of understanding and reason in regard to their hyperphysical use."

Kant goes further than Aristotle in separating dialectic from science. With regard to the sensible or phenomenal world of experience science is possible with regard to the mind's own structure; the supreme sort of science is possible. But when reason tries to use its ideas for other objects, and then regards them as conceptions of actual things, their mode of application is transcendent and delusive. Kant explains that "an idea is employed transcendentally when it is applied to an object falsely believed to correspond to it immanently when it is applied solely to the employment of the understanding in the sphere of experience" and he maintains that when ideas are used transcendentally they do not give rise to science but "assume a fallacious and dialectical character."

A conclusion of dialectical reasoning according to Kant is either opposed by a conclusion equally acceptable to reason—a perfectly natural and theoretic—as in the antinomies of pure reason or as in the paradoxisms, the reasoning has specious cogency which can be shown to conclude falsely while the form is correct and unexceptionable. In this balance of reason against itself lies the illusory character of the transcendental dialectic.

Where Aristotle recognises that reason can be employed on both sides of a question because it is of two competing probabilities, Kant in calling dialect "a logic of appearance" explains his remark that this does not signify a doctrine of probability. He further distinguishes what he calls "transcendental illusory appearance from empirical illusory appearance and ordinary logical illusion." The latter two can be corrected and totally removed.

But transcendental illusion, on the contrary," he writes, "does not cease to exist even after it has been exposed and its nothingness has been clearly perceived by means of transcendental criticism."

The reason for this, Kant explains, is that here we have to do with a natural and unavoidable illusion which rests upon subjective principles, and imposes these upon us as objective.

There is, therefore, he continues, a natural and unavoidable dialectic of pure reason" which arises because the mind seeks to answer questions well nigh impossible to answer such as how objects exist as things in themselves or how the nature of things is to be subordinated to principles. In its effort to transcend experience—in disregard of all the warnings of criticism—the mind cannot escape the frustration of the dialectical illusion, which is an inseparable adjunct of human reason. It is not Kant repeatedly insists, that the ideas of pure reason are in their own nature dialectical; it is from their misuse and employment alone that fallacies and illusions arise."

OR HEGEL As for Plato dialectic moves in the realm of truth and ideas, not probabilities and illusions. But for Hegel dialectic is always the process of *transcendence* of the Idea in interminable motion toward absolute truth—never resting in the intuition of that truth. The Idea he writes, "is self-determined; it assumes successive forms which it successively transcends; and by this very process of transcending its earlier stages, gains an affirmative and in fact a richer and more concrete shape."

The dialectical process is a motion in which contrary and defective truths are harmonized. The synthesis of *thesis* and *antithesis* results in a more complete truth. To illustrate his meaning Hegel uses the example of building a house. For such a purpose we must have in the first instance a subjective aim and design and as means, the several substances required for the work—iron, wood, stones. In rendering these materials suitable for our purpose we make use of the elements fire to melt the iron, wind to blow the fire, water to set the wheels in motion, in order to cut the wood etc."

"Let the house that we build in, according to

ultimate fruit of intellectual labor—knowledge itself and in its supreme form as a vision of being and unity. That is why Socrates makes it the ultimate study in the curriculum proposed for training the guardians to become philosopher kings. Dialectic he says is the coping stone of the sciences and is set over them no other science can be placed higher—the nature of knowledge can go no further.

For Aristotle dialectic far from being at the summit of science and philosophy lies at their base and must be carefully distinguished from sophistry which it resembles in method. Dialecticians and sophists assume the same guise as the philosopher Aristotle writes for sophistic is wisdom which exists only in semblance and dialecticians embrace all things in their dialectic and being is common to all things but evidently their dialectic embraces these subjects because these are proper to philosophy. Sophistic and dialectic he continues turn on the same class of things as philosophy but philosophy differs from dialectic in the nature of the faculty required and from sophistic in respect of the purpose of the philosophic life. Dialectic is merely critical where philosophy claims to know and sophistic is what appears to be philosophy but is not.

ACCORDING TO ARISTOTLE dialectic is neither itself a science nor the method of science. It is that part of logic or method which he treats in the *Topics* and it differs from the scientific method expounded in the *Posterior Analytics* as argument in the sphere of opinion and probabilities differs from scientific demonstration. Unlike the conclusions of science the conclusions of dialectical reasoning are only probable because they are based on assumptions rather than self evident truths. Since other and opposite assumptions cannot be excluded one dialectical conclusion is usually opposed by another in an issue of competing probabilities.

Intermediate between science and rhetoric dialectic can serve both. In addition to its practical employment in forensics it is useful in the philosophical sciences because it develops skill in making and criticizing definitions and in asking or answering questions. The ability to raise searching difficulties on both sides of a subject Aristotle says will make us detect

more easily the truth and error about the several points that arise.

Though it is primarily a method of arguing from assumptions and of dealing with disputes arising from contrary assumptions dialectic is also concerned with the starting points of argument. The *Topics* considers how assumptions are chosen what makes them acceptable what determines their probability. Here again Aristotle shows how the philosopher can make use of dialectic—as that process of criticism whereby lies the path to the principles of all inquiries.

THERE ARE FOUR major expositions of dialectic in the tradition of the great books. It is as varied as a conception in the thought of Kant and Hegel as it is in the philosophies of Plato and Aristotle. With differences which may be more important than the similarities the Kantian treatment resembles the Aristotelian the Hegelian the Platonic.

Like the division between the *Posterior Analytics* and the *Topics* in Aristotle's *Org. non.* the transcendental logic of Kant's *Critique of Pure Reason* falls into two parts—the analytic and the dialectic. The distinction between his transcendental logic and what Kant calls general logic is discussed in the chapter on Logic, but here it must be observed that for him general logic considered as an organon must always be a logic of illusion that is, be dialectical. He thinks that the ancients used the word dialectic in this sense to signify a sophistical art for giving ignorance may even intentional sophistries the coloring of truth in which the thoroughness of procedure which logic requires was unimitated. For his own purposes however he wishes dialectic to be understood in the sense of a critique of dialectical illusion.

When he comes to his own transcendental logic therefore he divides it into two parts. The first part deals with the elements of pure cognition of the understanding and the principles without which no object at all can be thought. This is the Transcendental Analytic and at the same time a logic of truth—a logic of science. Since in his view it ought properly to be only a canon for judging of the empirical use of the understanding this kind of logic is misused when we seek to employ it as

It is only in the writings of Hegel or his followers that the meaning of dialectic is not limited to the activity of human thought. Hegel expressly warns that the so-called dialectic is not an activity of subjective thinking applied to some matter externally, but is rather the matter's very soul putting forth its branches and fruit organically. It is the development of the Idea which is the proper activity of its rationality. If the whole world in its existence and development is the thought and thinking of an Absolute Mind or the Idea then the events of nature and of history are moments in a dialectical process of cosmic reproduction. The principles of dialectic become the principles of change and change itself is conceived as a process of evolution from lower to higher, from part to whole, from the indeterminate to the determinate.

The dialectical pattern of history conceived by Hegel as the progress & objectification of spirit is reconstructed by Karl Marx in terms of the conflict of material forces. Marx himself explicitly contrasts his dialectic with that of Hegel. "My dialectic method," he writes, "is not only different from the Hegelian but is its direct opposite." Hegel, he claims, thinks that the real world is only the external, phenomenal form of the Idea whereas his own view is that "the real is nothing else than the material world reflected by the human mind and translated into forms of thought."

Nevertheless, with respect to dialectic, Marx praises Hegel for being "the first to present its general form of working in a comprehensive and conscious manner." The only trouble is that with Hegel dialectic is standing on its head. It must therefore "be turned right side up again" a revolution which Marx thinks he accomplishes in his dialectical materialism.

Having put dialectic on its proper basis, Marx constructs the whole of history in terms of a conflict of material forces, or of social classes in economic strife according to a dialectical pattern which provides "recognition of the existing state of things, at the same time as the recognition of the negation of that state of things breaking up." History is thus viewed dialectically as in fluid move-

ment" yet it is also conceived as working towards a definite end—the revolution which has as its result the peace of the classless society. Bourgeois industry by bringing about the concentration and association of the proletariat produces its own grave diggers; its fall and the victory of the proletariat are equally inevitable.

In Marx's vocabulary the phrases "historical materialism" and "dialectical materialism" are strictly synonymous. But Marx's protest to the contrary notwithstanding a comparison of Marx and Hegel seems to show that a dialectic of history is equally capable of being conceived in terms of spirit or of matter.

The question whether there is a dialectic of nature as well as a dialectic of history remains a point of controversy in Marxist thought despite the bearing which Hegel's *Science of Logic* and *Phenomenology of Mind* might have upon the question. Engels tries in his *Dialectics of Nature* to give a fuller rendering of the Hegelian dialectic in strictly materialistic terms. Its universal scope including all of nature as well as all of history is also reflected in certain post-Darwinian doctrines of cosmic evolution.

CONSIDERATIONS RELEVANT to the Hegelian or Marxist dialectic will be found in the chapters on HISTORY and PROGRESS. Without judging the issues which Hegel and Marx have raised in the thought of the last century, it may be permissible to report the almost violent intellectual erosion they have produced in certain quarters. Freud for example is as unsympathetic in his criticism of Marx and as uncompromising in his rejection of dialectical materialism, as James before him is extreme in the expression of his distaste for Hegel. Mocking the Hegelians who think that the glory and beauty of the psychic life is that in all contradictions find their reconciliation, James declares "With this intellectual temper I confess I cannot contend."

The Hegelian dialectic and what James calls the pantomime-state of mind are, in his opinion, emotionally considered one and the same thing. In the pantomime all common things are represented to happen in impossible ways, people jump down each other's throats, houses turn inside out old women become young men

Hegel an opposite or antithesis of these elements. The wind which has helped to build the house is shut out by the house so also are the violence of rains and floods and the destructive powers of fire so far as the house is made fire proof. The stones and beams obey the law of gravity—press downward—and so high walls are carried up. The result is that the elements are made use of in accordance with their nature and yet to cooperate for a product by which their operation is limited. The initial opposition between the idea of a house and the elements is reconciled in the higher synthesis which is the house itself.

While it shows the opposing theses and the resulting synthesis this example does not fully exhibit the dynamic character of the Hegelian dialectic. If the resulting synthesis is not the whole truth it too must be defective and require supplementation by a contrary which is defective in an opposite way. These two together then become the material for a higher synthesis another step in that continuing dialectical process which is the life of mind—both the subjective dialectic of the human mind and the objective dialectic of the Absolute Mind or the Idea.

**THE THREAD OF common meaning which runs through these four conceptions of dialectic is to be found in the principle of opposition. In each of them dialectic either begins or ends with some sort of intellectual conflict or develops and then resolves such oppositions.**

For Kant dialectical opposition takes the extreme form of irreducible contradictions from which the mind cannot escape. It is a melancholy reflection he declares that reason in its highest exercise falls into an antithetic. This comes about because all statements enunciated by pure reason transcend the conditions of possible experience beyond the sphere of which we can discover no criterion of truth while they are at the same time framed in accordance with the laws of the understanding which are applicable only to experience and thus it is the fate of all such speculative discussions that while the one party attacks the weaker side of his opponent he infallibly lays open his own weaknesses.

For Hegel the opposition takes the milder form of contrary theses and antitheses. They can be dialectically overcome by a synthesis which remedies the incompleteness of each half truth. It is one of the most important discoveries of logic Hegel says that a specific moment which by standing in an opposition has the position of an extreme ceases to be such and is a moment in an organic whole by being at the same time a means. The Hegelian opposition is thus also mediation.

Dialectical opposition for Aristotle originates in the disagreements which occur in ordinary human discourse. But just as disagreement is reasonable only if there are two sides to the question in dispute so reason can operate dialectically only with regard to genuinely arguable matters. The familiar topics concerning which men disagree represent the commonplace issues of dialectic since for the most part they are formed from debatable propositions or questions. Nobody in his senses Aristotle believes would make a proposition of what no one holds nor would he make a problem of what is obvious to everybody or to most people. Each of the conflicting opinions will therefore have some claim to probability. Here the dialectical process ends neither in a synthesis of incomplete opposites nor in a rejection of both as illusory but having an eye to general opinion it seeks to ascertain the more reasonable view—the more tenable or probable of the two.

In the Platonic theory of dialectic the element of opposition appears in the tension between being and becoming the one and many or the intelligible and the sensible which is found present in every stage of the mind's dialectical ascent to the contemplation of ideas. So fundamental is this tension that Socrates uses it to define the dialectician as one who is able to see a One and Many in Nature—by comprehending scattered particulars in one idea and dividing it into species according to their natural formation. Here as in the Hegelian theory the oppositions—apparent contradictions in discourse—can be resolved by dialectic and through their resolution the mind rises to a higher level.

## REFERENCES

To find the *passages* cited use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example in 4 Hesiod *Iliad* BK II [65 283] 12d, the number 4 is the number of the column in the set; the number 12d indicates that the passage is in section d of page 12.

**P or Section.** When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 *Lucretius* *Physics* 116a 119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of page and the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposium* 163b-164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**Author.** Divided O or more of the individual sections of a work (such as *Prophets*, *Exodus*, etc.) at some times included in the reference. The numbers, in brackets, are given in certain cases, e.g. *Iliad* BK II [26, 53] 12d.

**B & Ref. a, b, c.** The references are to books, chapters and verse. When the King James and Douay versions differ in the books or in the numbering of chapters or verses, the King James version is cited first and the Douay und cited below it (D). For example, Old Testament, *Achabiah* 43-(D) *II Ezra* 146.

**S and L.** The abbreviation *etc.* calls the reader's attention to one or more especially relevant parts of a whole reference. "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style for general guidance in the use of *The Great Ideas*; consult the Preface.

## Chapter 19 DUTY

### INTRODUCTION

LOCKE discussing in the course of his essay *On Human Understanding* why a man must keep his word notes that we meet with three different answers to this question. If a Christian be asked he will give as reason Because God who has the power of eternal life and death requires it of us. But if a Hobbit be asked why? he will answer Because the public requires it and the Leviathan will punish you if you do not. And if one of the old philosophers had been asked he would have answered Because it was dishonest below the dignity of a man and opposite to virtue the highest perfection of human nature to do otherwise.

With these three answers Locke introduces us to some of the alternative views on what is perhaps the central problem concerning duty. All three acknowledge the existence of duty and the force of obligation. By accepting the question they affirm the proposition that a man *must* or *ought* to keep his word. But why? What creates the *ought* or obligation?

Two of the answers Locke cites—that of the Christian and that of the Hobbit—seem to derive duty from the commands of law, the law of God or of the state, in either case a law to be enforced by the sanctions of a superior power. Accordingly the citizen has duties to the state, the religious man to God. Yet it does not seem to be entirely the case that such duties rest exclusively on the *superior power* of God or the state. Men who obey either divine or civil law from fear of punishment alone are said to act not from duty but from expediency—in terms of a calculation of risks and consequences.

Obedience to law would appear to be acknowledged as a duty only by those who recognize the authority of the law or the right of the lawmaker to command. They would be willing to obey the law even if no external sanction could be enforced against them by a superior

power. Those whom the law binds in conscience rather than by its coercive force obey the law because it is morally right to do so. The sense of the law's moral authority is for them the sense of duty from which the dictates of conscience flow.

Locke's third answer—that of the ancient philosophers—shows that duty is sometimes understood without reference to law divine or human. We share this understanding whenever having made a promise or contracted a debt we feel an obligation to discharge it even if no superior commands the act. Here furthermore the obligation seems to be to another individual—to a person who may be our equal—rather than to the state or God.

As indicated by Locke's statement of this ancient view, it is the honest or just man who acknowledges such obligations apart from the law or his relation to any superior. Virtue may of course also direct a man to act for the common welfare and to obey the laws of the state or the commandments of God. But the immediate source of the obligation to act in a certain way toward one's fellow men is placed by the ancients according to Locke in virtue of the highest perfection of human nature. On this view *virtue alone provides the motivation*. Without it men would act lawfully only because of the law's coercive force. Without it men would recognize no obligations to their fellow men or to the state.

These two conceptions of duty—for the moment grouping the Christian and Hobbit answers together against the ancient view—may seem at first to be only verbally different. It seems certain that *dutiful conduct* would frequently be the same on either view. Let them do conflict with one another and each if examined further presents difficulties.

The theory that duty arises from a man's own virtue receives its classic expression as Locke intimates in the ancient philosophers particularly Plato and Aristotle. It appears in the *Republic* for example when Socrates has to meet Glaucon's argument that men abide by moral rules not simply because they ought to but in order to avoid the pain of censure and punishment. Glaucon claims that given the possession of Gyges' ring, which can render a man invisible to others, no man would keep his hands off what was not his own when he could safely take what he liked. He could in all respects be like a God among men.

Against this Socrates sets his conception of the just man who does what he ought to do because it is just and because justice is essential to the very life and health of the soul. According to Socrates' way of thinking it is ridiculous to ask which is the more profitable to be just and act justly and practise virtue whether seen or unseen of gods and men or to be unjust. We know that when the bodily constitution is gone life is no longer endurable though pampered with all kinds of meat and drunks and having all wealth and all power and shall we be told that when the very essence of the vital principle is undermined and corrupted life is still worth having to a man if only he is allowed to do whatever he likes with the same except on that he is not to acquire justice and virtue or to escape from injustice and vice?

On this view it seems to be the virtue of justice which lies at the root of duty or obligation. But for Plato justice though only one of the virtues is inseparable from the other three—temperance, courage and wisdom. It is almost indifferent therefore whether one attributes moral obligation to the particular virtue of justice or to virtue in general. As the chapters on JUSTICE and VIRTUE indicate Aristotle differs from Plato both with respect to the virtues in general and to justice in particular. For Aristotle it is justice alone not virtue in general or any other particular virtue which gives rise to duty or obligation.

In this he differs from the other virtues according to Aristotle in that 1. alone of the virtues is thought to consist another's good because it concerns the relation of a man to his neighbour. The other virtues such as temperance

and courage do not give rise to obligations unless they are somehow annexed to or united with justice. Whenever Aristotle speaks of duties he does so with reference to the obligations that follow from justice—the duties of parents to children and those of brothers to each other those of comrades and those of fellow-citizens.

Whereas for Aristotle justice always refers to the good of another or to the common good of all such virtues as temperance and courage when they are isolated from justice concern the well-being of the individual himself. That is why only justice entails duties which are obligations to act in a certain way for the welfare of others. If the good of no other individual is involved it seems that a man has no duty to be temperate or courageous even when he possesses these virtues.

Precisely because of the essentially social character of justice Aristotle raises the question whether a man can treat himself unjustly or not. He is willing to admit that a man can do justice or injustice to himself only in a metaphorical sense. What he calls metaphysical justice is not a relation between a man and himself but a relation between one part of himself and another.

Aquinas seems to follow Aristotle in connecting duty with justice and with no other virtue. Justice alone of all the virtues he writes implies the notion of duty. If he also intimates that duty may somehow enter into the acts of other virtues—as when he says that it is not so patent in the other virtues as it is in justice—his position still remains fundamentally Aristotelian. Referring to that kind of metaphorical justice to which Aristotle appeals in stating the sense in which a man can treat himself unjustly Aquinas explains how all the other virtues can be said to involve the duty of the lower powers to reason. Apart from this metaphorical duty of the passions to obey reason duty in the strict sense comes in the opinion of Aquinas only from the precept of justice which concerns the relation of one person to another.

On this theory duty is not co-extensive with morality the sense of duty is not identical with the moral sense and specific duties oblige a

man to other men even when no general law exists to be obeyed. Difficulty is found with this theory by those critics who think that the whole of morality not simply one part of it involves duties. Does not the sense of duty operate they ask in matters which do not affect any other individual or even the common good? Does a man for example have a duty to tell the truth only to others but not to seek it for himself? Kant as we shall see holds that there are private as well as public duties or in his language internal duties in the realm of ethics as well as external duties in the realm of jurisprudence.

The Hobbesian theory of duty seems to face similar difficulties. The specific duties which are determined by the precepts of justice may as we have seen not always be the same as the specific duties imposed by civil law though they will be identical whenever the law of the state is itself an expression or determination of justice. But when law rather than justice is the principle duty seems to consist primarily in obedience to the law or rather to the lawgiver who has superior power and authority. Only secondarily or in consequence does it involve obligations to other men who are one's equals.

With Hobbes for example justice and obligation as well begin only with the establishment of a constituted authority with the power of making laws. Where there is no Commonwealth he writes there is nothing unjust. So that the nature of justice consisteth in keeping of valid covenants but the validity of covenants begins not but with the constitution of a civil power sufficient to compel men to keep them. Duty and justice are both said to be laws of nature but Hobbes adds they are not properly laws but qualities that dispose men to peace and to obedience until a Commonwealth is once settled and then they become the commands of the Commonwealth. In other words it is the Sovereign power that obliges men to obey them and obedience which is said to be part also of the law of nature is its proper expression.

So far the two conceptions conflict or at least diverge. But if the legal theory of duty goes no further than the enactments of the state the same question arises here as before. Does a man have no duties apart from his relation to the

state? Can duty be co-extensive with morality if the only rules of conduct to be obeyed are laws imposed from without—regulations which have authority simply because they come from one who has the right to command? Again as we shall see Kant would say No.

WE HAVE now stated the questions about duty which raise difficulties for Aristotle and Hobbes. Though they differ in their theories of law and justice as well as in their conceptions of duty they seem to concur in thinking that doing one's duty does not exhaustively solve all moral problems.

The same questions do not however seem to present difficulties to other moralists—to Kant and to the Stoics of antiquity such as Marcus Aurelius and Epictetus. On the contrary their moral philosophy by making the sphere of duty co-extensive with the whole of the moral life seems to prevent such questions from being raised.

As we turn to examine their conception of duty we must observe that in two respects it alters Locke's threefold division of the answers to the question Why must a man keep his word? In the first place Locke's statement of the answer given by the ancient philosophers seems to have only Plato and Aristotle in mind certainly not the Stoics. In the second place Locke's statement of the Christian position seems to associate it with the Hobbesian answer against that of Plato and Aristotle. That association may be justified on the ground that duty to God like duty to the state involves obligation to a superior. But Aquinas as we have seen seems to agree with Aristotle about justice as a source of duty and as we shall see he also seems to agree with Kant and the Stoics about the pervasiveness of duty in the realm of morals. Locke's statement of the Christian position which selects one aspect of it only may therefore be inadequate.

The point which unites Kant the Stoics and Aquinas is their agreement concerning the existence of a law which is neither enacted by the state nor proclaimed by God in his revealed commandments. This law the Stoics speak of as the law of reason. Aquinas calls the natural law and Kant conceives to be the moral law within. The common conception thus van-

only expressed is more fully treated in the chapter on Law but that ampler discussion is not needed to perceive that the law of reason or of nature is a moral law in that its general principles and detailed precepts govern the entire range of moral acts.

Moralists according to Kant consists in the reference of all action to the legislation which alone can render a kingdom of ends possible. By this he means that the will is never to act on any maxim which could not without contradiction be also a universal law. This law is also moral in the sense that it exercises only moral authority and should prevail even without the support of the external sanctions which accompany the positive commands of a superior. The idea of duty, Kant declares, "would alone be sufficient as a spring [of action] even if the spring were absent which is connected by force of legislation—namely external compulsion.

Making the natural or moral law the principle of duty introduces the element of obligation into every moral act. Whatever is right to do we are obliged to do in conformity to the law of nature or in obedience to the commands of the moral law. We need no external pronouncement of this law—i.e., no express formulation in words by a law-giver—for this law is inherent in reason itself. Its various maxims or precepts can be deduced from what Aquinas calls the first principle of the practical reason and Kant the categorical imperative. Or as the Stoics say, one reason is the ruling principle in man; man's duty consists in holding fast to it and going straight on so that it has what is its own.

On this theory we are obliged in conscience to do what reason declares in fit whether or not others are directly involved. The distinction between public and private morality—between the spheres of justice and the other virtues—is irrelevant to conscience. Conscience also to Kant functions equally in the spheres of internal and external duty. In both the realm of ethics and the realm of jurisprudence conscience applies, the moral law dictates our duty in the particular case. We stand in no different relation to ourselves and others since the moral law is universally and equally binding on all persons. The obligation is in

every case to obey the law. It is not a duty to persons except as the moral law commands us to respect the dignity of the human person ourselves and others alike.

The element of a superior command in an inferior seems to be present in this conception of duty through the relation of reason to the will and appetites of man. Acting dutifully consists in the submission of the will to reason and in overcoming all contrary inclinations or desires. But though Kant sometimes speaks in these terms he also conceives duty as carrying with it an obligation to God. The subjective principle of a responsibility for one's deeds before God he says is contained though it be only obscurely in every moral self-consciousness.

Nevertheless, Kant insists that the Christian principle of morality itself is not theological. It rests, in his opinion on the autonomy of pure practical reason since it does not make the knowledge of God and his will the foundation of these laws, but only of the attainment of the *summum bonum* on the condition of following these laws, and it does not even place the proper spring of this obedience in the desired results, but solely in the conception of duty as that of which the faithful observance alone constitutes the worthiness to obtain those happy consequences.

It is through the *summum bonum* as the object and final end of pure practical reason that in Kant's view of Christian morality the pass from moral philosophy to religion that is, to the recognition of all duties as divine commands. A Christian theologian like Aquinas, however seems to go further than Kant in equating conformity to the moral law—or the natural law of reason—with religious obedience to God. Nor does he explain this equivalence by reference to the fact that God has made man's attainment of the *summum bonum*—or eternal happiness—depend on his free compliance with the moral law. Rather for Aquinas the natural law is "nothing else than the rational creature's participation in the eternal law" of God—the imprint on us of the divine light. As God is the author of man's nature and reason, so is He the ultimate authority behind the commands of the natural law which He imprinted in man's reason at creation.

For a Christian theologian like Aquinas duty to God involves obedience to the moral law which reason can discover by itself no less than obedience to those positive commandments which God has revealed to man. Aquinas seems to think that violation of the natural law is as much a sin as violation of the divine law. Both involve a rupture of that order laid down by God the one in relation to the rule of reason in so far as all our actions and passions should be commensurate with the rule of reason—the other in relation to the rule of the divine law. Thus in all moral matters it would appear that duty is in Wordsworth's phrase "stern daughter of the voice of God." If the natural law commands us to use our faculties to the ends for which they were created then the possession of a mind imposes upon us what Socrates in the *Apology* calls man's duty to inquire. If we fail to seek the truth we sin against God by sinning against our nature even though "Thou shalt seek the truth" is nowhere explicitly prescribed in Holy Writ.

**ETHICAL DOCTRINES** can be classified according to the role which they assign to duty as a moral principle. There is perhaps no more fundamental issue in moral philosophy than that between the ethics of duty and the ethics of pleasure or happiness. This issue obviously belongs to the chapters on **HAPPINESS** and **PLEASURE** as well as the present one. All three must be read together—and perhaps also the chapters on **DESIRE**, **LAW** and **VIRTUE**—to complete the picture.

According to the morality of duty every act is to be judged for its obedience or disobedience to law and the basic moral distinction is between right and wrong. But where pleasure or happiness are central the basic distinction is between good and evil and desire rather than law sets the standard of appraisal. An analysis of means and ends and a theory of the virtues are usually found in the ethics of happiness as a theory of conscience and sanctions is usually prominent in the ethics of duty.

At one extreme there is the position which totally excludes the concept of duty. This fact more than any other characterizes the Epicureanism of Lucretius. The good life for him is one where nature craves for herself no more than

this that pain hold aloof from the body and she in mind enjoy a feeling of pleasure exempt from care and fear. The life he describes—so disciplined and moderated that all but the simplest pleasures are relinquished in the effort to avoid pain—seems to leave no place for obligation or social responsibility.

In the much more elaborate moral philosophy of Aristotle virtue entails moderation in the avoidance of pain as well as in the pursuit of pleasure. Though he admits that most pleasures might perhaps be bad without qualification Aristotle claims that the chief good which is happiness would involve some pleasure. But even as a good pleasure is not the only good for there are other objects of desire.

The happy man according to Aristotle is one who somehow succeeds in satisfying all his desires by seeking the various kinds of goods in some order and relation to one another. Happiness itself is something that we choose always for itself and never for the sake of something else. Although we may also choose other things in some sense for themselves such as honor, pleasure, reason, and every virtue still they are chosen for the sake of happiness since we judge them as the means by which we shall be happy.

In Aristotle's ethics of happiness duty is not entirely excluded but neither is it given any independent significance. As we have seen it is merely an aspect of the virtue of justice and amounts to no more than the just man's acknowledgment of the debt he owes to others or his recognition that he is under some obligation to avoid injuring other men and to serve the common good.

At the other extreme there is the position which identifies the sense of duty with the moral sense. In the Stoicism of Marcus Aurelius and Epictetus to live well is to do one's duty and to set aside all contrary desires. It is thy duty, the Emperor writes, to order thy life well in every single act and if every act does its duty as far as is possible be content and no one is able to hinder thee so that each act shall not do its duty. Man is not destined to be happy his happiness consists rather in doing what is required of him at his post of duty in the order of the universe. The only good is a good will.

a dutiful will a will which conforms itself to the law of nature.

Kant's much more elaborate moral philosophy presents the same fundamental teachings. This is indicated by the fact that he associates what he calls *eudemonism* (i.e. the ethics of happiness) with *hedonism* (i.e. the ethics of pleasure). Happiness, he writes, is a rational being's consciousness of the pleasantness of life uninterruptedly accompanying his whole existence" and its basis is "the principle of self-love." Therefore according to Kant both eudemonism and hedonism commit the same error. Both "undermine" morality and destroy its stability since they put the motives to virtue and to vice in the same class, and only teach us to make a better calculation." Both admit desire as a moral criterion of good and evil. Both are utilitarian in that they are concerned with consequences, with means and ends. Both measure the moral act by reference to the end it serves.

For Kant, an action done from duty derives its moral worth not from the purpose which is to be attained by it but from the maxim by which it is determined and therefore does not depend on the realization of the object of the action, but merely on the principle of volition by which the action has taken place without any regard to any object of desire.

Duty "he goes on to say "is the necessity of acting from respect for the law." From this he argues that duty, and consequently all moral action, must be done because it is in it because the law commands it, and for no other reason. The recommendation of any action solely on the ground that it will contribute to happiness as satisfying the inclination of the person and achieving the object of the will is completely ruled out. That would be a judgment of pure expediency. Worse than not moral it is, in the opinion of Kant, immoral.

"An action done from duty," Kant writes, "must wholly exclude the influence of inclination, and with it every object of the will so that nothing remains which can determine the will except objectively the law and subjectively pure respect for this practical law and consequently the maxim that I should follow this law even to the thwarting of all my inclinations. The pre-eminent good which we call

moral can therefore consist in nothing else than the conception of law in itself which certainly is only possible in a rational being in so far as this conception and not the expected effect determines the will.

This law which is the source of duty and of all moral action is Kant's famous "categorical imperative"—or in other words reason's unconditional command. According to its decree Kant declares "I am never to act otherwise than so that I could also will that my maxim should become a universal law." By obeying the categorical imperative we can know and do our duty and rest assured that our will is morally good. I do not therefore need any far-reaching penetration to discern what I have to do." Kant writes in order that my will may be morally good. Inexperience in the course of the world incapable of being prepared for all its contingencies, I only ask myself Canst thou also will that thy maxim should be a universal law? If not then I must be rejected and that not because of a disadvantage accruing from it to myself or even to others, but because it cannot enter as a principle into a possible universal legislation.

To say that a man ought to do this or restrain from doing, that in order to achieve happiness is, for Kant at best a conditional obligation ultimately a specious one since he is not unconditionally obliged to be happy. Kant does not totally exclude happiness or the *suntkum tomen*. In fact he says that there is no need to maintain an opposition between them and morality. But he claims that the moment duty is in question we should take no account of happiness. Just as Aristotle treats duty only in terms of justice so Kant considers happiness to have a moral quality only insofar as to be worth of it is an end set by the moral law.

TWO OTHER voices join in this great argument concerning duty and happiness. One is that of John Stuart Mill whose *Liberum agere* recognizes Kant as the chief opponent of an ethics of happiness. Though Mill differs from Aristotle on many points, particularly in regard to the duties as means to happiness Mill's answer to Kant can be read as a defense of Aristotle as well as of his own theory.

From Kant's point of view they are both

utilitarians They both argue in terms of means and ends They both make purely pragmatic not moral, judgments—judgments of expediency instead of judgments of right and wrong

From Mill's point of view Aristotle like himself needs no other principle of morality than happiness in ultimate end which justifies every means that tends towards its realization The ultimate sanction of all morality external motives apart Mill writes is a subjective feeling in our own minds He asserts that when once the general happiness is recognized as the ethical standard it will appeal to a powerful natural sentiment Man's nature as a social being he holds tends to make him feel it one of his natural wants that there should be harmony between his feelings and aims and those of his fellow creatures

This conviction in persons who have it does not present itself to their minds as a superstition of education or a law despotically imposed by the power of society but as an attribute which it would not be well for them to be without This conviction rather than an internal sense of obligation or fear of external sanctions imposed by a superior power is for Mill the ultimate sanction of the greatest happiness morality—which aims at the greatest happiness for the greatest number

Where Mill answers Kant by excluding duty—even from considerations of justice—Aquinas seems to develop an analysis in which every moral act can be regarded as obeying or dis obeying the natural law and yet at the same time be judged as a means which serves or fails to serve the ultimate end of man's natural desire The order of the precepts of the natural law is in the words of Aquinas according to the order of natural inclinations The dilemma set up by the opposition between duty and happiness seems to be denied or at least avoided by a theory which finds a perfect parallelism between the precepts of natural law and the objects of natural desire a parallelism resulting from their common source in the creation of human nature by God

THE TENSION between duty and desire—between obedience to rules of conduct and unrestrained indulgence—is one of the burdens which no other animal except man must bear It

is a constant theme in the great poems It is pivotal to the plot of most of the great love stories It is a theme of tragedy for in which ever direction the tension is resolved—whether in the line of duty (as by Aeneas forsaking Dido) or in disobedience to law (as by Adam yielding to Eve in *Paradise Lost*)—triumph results

The tragedy of being both rational and animal seems to consist in having to choose between duty and desire rather than in making any particular choice It may be significant however that the tragic heroes of poetry more frequently abandon duty than desire or love though seldom without mortal punishment preceded by a deep sense of their transgression Sometimes however they are self-deceived and cloak desire in the guise of duty

There is another source of tragic conflict in the sphere of duty Men are torn by competing loyalties obligations which pull them in opposite directions In the basic relationships of the family the duty a man owes to his parents vis à vis cannot be discharged without violating or neglecting obligations to his wife Whether the moral law and the law of the state command contrary actions duty is weighed against duty in an ordeal of conscience Sometimes however one obligation seems to take clear precedence over another as in the mind of Sophocles Antigone for whom the king's edict loses its authority when it runs counter to the law of God Creon the king not Antigone his subject, may be the play's more tragic personage He sacrifices a dearly beloved son to uphold the authority & considers it his duty as a ruler to maintain

If man is not a rational animal or if whatever his nature reason is not its ruling principle then the sense of duty would appear to be an imposture that draws its driving force from the emotional energies with which certain man made rules of conduct are invested Rather than acting is a counterweight to desire duty is itself the shape which certain desires take to combat others

Conscience or the super ego according to Freud is born of the struggle between the ego and the id Translated into popular language Freud tells us the ego stands for reason and circumspection while the id stands for the un tamed passions What may originally have had a necessary function to perform in the psyche

economics can grow to play too dominant a part. For the psychoanalyst, not tragedy, but neurosis results from an overdeveloped sense of duty. When "the ego [ ] forced to acknowledge its weakness," Freud explains, it "breaks out into anxiety, reality anxiety in face of the external world, normal anxiety in face of the super-ego, and neurotic anxiety in face of the strength of the passions in the id."

The relation of ruler and ruled in the domestic or the political community may seem at first to impose duties or obligations only on the ruled. The ruler commands. His subjects are obliged to obey. Does the ruler in turn have no duties, no obligations to those whom he governs? If he has none, then neither have the persons he rules rights which he must respect. Such absolute rule—defined by a correlative absence of duties in the ruler and rights in the ruled—has been one conception of the relation between master and slave.

In the state rulers who are merely office-holders are obligated by the duties of their

office as well as vested with its authority and power. The office-holder duty-bound by the constitution, is not an absolute ruler. He is, in fact, a servant of the state, not its master. The mediaeval king who pledged himself in his coronation oath to discharge the duties of his office may not have been bound by human law but so long as his conscience kept him loyal to his pledge, he recognized the supremacy of the natural law or of the law of God. The self-governing citizen of a republic is similarly duty-bound only when he recognizes the supremacy of the common good.

According to the theory of constitutional government, rights and duties are correlative. The acknowledgment of duties signifies that the holder of rights recognizes their limited or conditional character. To consider oneself entirely exempt from duties or obligations is to regard one's rights as absolute. Can anyone have absolute rights except on condition of being, without a superior of any sort? One unlikely answer to this question is that neither despot nor state but only God, is autonomous or without duty.

## OUTLINE OF TOPICS

1. The concept of duty or obligation: its moral significance	362
2. Comparison of the ethics of duty with the ethics of happiness, pleasure or utility	366
3. The two kinds of duty: internal and external duty; the realms of ethics and jurisprudence	367
4. The sense of duty	
4 <sup>a</sup> : The moral and social development of conscience: its dictates	
4 <sup>b</sup> : The emotional development of conscience: its morbid manifestations	368
5. The derivation of duty from duty in natural and civil law and from the categorical imperative of reason	368
6. Conflicts between duties of diverse origins	369
The relation of duty to justice and to rights: oaths and promises	
8. The ratio between duty and interest: hate or love	370
9. The duties of command and obedience in family life	
10. Political obligation: care, functions, loyalties	371
11. Duties to God: prayer and worship	373

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in 4 HOMER *Iliad* BK II [265-283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS** When the text is printed in one column the letters a and b refer to the upper and lower halves of the page. For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters c and d refer to the upper and lower halves of the left hand side of the page the letters e and f to the upper and lower halves of the right hand side of the page. For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS** One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e.g. *Iliad* BK II [265-283] 12d.

**BIBLE REFERENCES** The references are to book chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e.g. Old TESTAMENT *Nehemiah* 7:45-(D) II *Esdras* 7:46.

**SYMBOLS** The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference. passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.

# Chapter 20 EDUCATION

## INTRODUCTION

THE great books assembled in this set are offered as means to a liberal or general education. The authors of these books were educated men more than that they typified the ideal of education in their various epochs. As their writings reveal their minds were largely formed or at least deeply impressed by reading the works of their predecessors. Many of them were related as teacher and student sometimes through personal contact sometimes only through the written word. Many of them were related as divergent disciples of the same master yet they often differed with him as well as with one another. There is scarcely one among them—except Homer—who was not acquainted with the minds of the others who came before him and more often than not profoundly conversant with their thought.

Yet not one of the writings in this set is specifically a treatise on education except Montaigne's essay *Of the Education of Children*. Some of these authors speak more or less fully of their own education as does Marcus Aurelius in the opening book of his *Meditations*, Augustine in his *Confessions*, Descartes in his *Discourse* and Boswell. Others refer to their educational experience in fictional guise as does Aristophanes in the argument in the *Clouds* between the Just and Unjust Discourses or Rabelais when he tells of Gargantua's school in Gargantua's letter to Pantagruel. Sometimes they report the way in which other men were trained to greatness as does Plutarch or like Gibbon Hegel and Mill they describe and comment on the historic systems of education.

In still other instances the great books contain sections or chapters devoted to the ends and means of education, the order of studies, the nature of learning and teaching, the training of statesmen and citizens as for example

Plato's *Republic*, Aristotle's *Politics*, Augustine's *Christian Doctrine*, Bacon's *Advancement of Learning*, Adam Smith's *Wealth of Nations*, Hegel's *Philosophy of Right* and the psychological writings of James and Freud. But in no case is education the principal theme of these books, as it is for most of the works cited in the list of Additional Readings among which will be found treatises on education by authors in this set.

EDUCATION is not itself so much an idea or a subject matter as it is a theme to which the great ideas and the basic subject matters are relevant. It is one of the perennial practical problems which men cannot discuss without engaging in the deepest speculative considerations. It is a problem which carries discussion into and across a great many subject matters—the liberal arts of grammar, rhetoric and logic, psychology, medicine, metaphysics and theology, ethics, politics and economics. It is a problem which draws into focus many of the great ideas—virtue and truth, knowledge and opinion, art and science, desire, will, sense, memory, mind, habit, change and progress, family and state, man, nature and God.

This can be verified by noting the diverse contexts in which education is discussed in the great books. In each connection we shall find some of the special questions which together make up the complex problem of education. For example, the nature of teaching and learning is examined in the wider context of psychological considerations concerning man's abilities, the way in which knowledge is acquired, and how it is communicated by means of language or other symbols. Different conceptions of the nature of man and of the relation of his several capacities surround the question of the ends of education. In this context

questions also arise concerning the parts of education—the training of man's body, the formation of his character, the cultivation of his mind—and how these are related to one another.

The whole theory of the virtues and of habit formation is involved in the question whether virtue can be taught or must be acquired in some other way and in related questions about the influence of the family and the state on the growth of character. These questions are also asked in terms of general political theory. Different views of the state are involved in questions about the division of responsibility for education among various agencies. Questions about the purpose of education and what sort of education shall be given to the diverse classes in the state are differently raised and differently answered in the context of discussions of different forms of government.

Though they are far from exhaustive these examples should nevertheless suffice to make the point that there can be no philosophy of education apart from philosophy as a whole. It may therefore not be a disadvantage to find the discussion of education in the great books almost always imbedded in the context of some more general theory or problem.

One opinion from which there is hardly a dissenting voice in the great books is that education should aim to make men good as men and as citizens. If you ask what is the good of education, Plato writes, the answer is easy—that education makes good men and that good men act nobly and conquer their enemies in battle because they are good. Men should enter upon learning Bacon declares, in order to give a true account of their gift of reason to the benefit and use of men, while William James stresses the need for a perfectly rounded development. Thus it would seem to be a common opinion in all ages that education should seek to develop the characteristic excellencies of which men are capable and that its ultimate ends are human happiness and the welfare of society.

Within this area of general agreement there are of course differences which result from the different views that are taken of man's relation to the state or to God. If the good of the state

takes precedence over individual happiness, then education must be directed to training men for the role they play as parts of a larger organism. Education then serves the purpose of preserving the state. Of all things Aristotle says, that which contributes most to the permanence of constitutions is the adaptation of education to the form of government. The best laws, he continues, though sanctioned by every citizen of the state will be of no avail unless the young are trained by habit and education in the spirit of the constitution.

Rousseau seems to take a similar view when he calls for a system of public education run by the state. Its object is to assure that the citizens are early accustomed to regard their individuality only in its relation to the body of the state and to be aware so to speak of their own existence merely as a part of that of the state. Taught in this way the citizens Rousseau claims, might at length come to identify themselves in some degree with this greater whole to feel themselves members of their country and to love it with that exultant feeling which no isolated person has save for himself.

If happiness cannot be fully achieved on earth then whatever temporal ends education serves must themselves be ordered to eternal salvation and the whole process of human development must be a direction of the soul to God. What did it profit me, Augustine asks in his *Confessions*, that all the books I could procure of the so-called liberal arts, the vile slave of vile affections, read by myself and understood? For I had my back to the light and my face to the things enlightened whence my face with which I discerned the things enlightened was not itself enlightened. Whatever was written either on rhetoric or logic, geometry, music and arithmetic by me self without much difficulty or any instructor I understood. Thou knowest O Lord my God because both quickness of understanding and acuteness in discerning is Thy gift yet did I not thence sacrifice to Thee. Wherefore Augustine concludes concerning this stage of his learning, it served not to my use but to my perdition. But Augustine does not therefore conclude that under no circumstances can liberal education be put to good use. In his

# Chapter 20 EDUCATION

---

## INTRODUCTION

THE great books assembled in this set are offered as means to a liberal or general education. The authors of these books were educated men more than that they typified the ideal of education in their various epochs. As their writings reveal their minds were largely formed or at least deeply impressed by reading the works of their predecessors. Many of them were related as teacher and student sometimes through personal contact sometimes only through the written word. Many of them were related as divergent disciples of the same master yet they often differed with him as well as with one another. There is scarcely one among them—except Homer—who was not acquainted with the minds of the others who came before him and more often than not profoundly conversant with their thought.

Yet not one of the writings in this set is specifically a treatise on education except Montaigne's essay *Of the Education of Children*. Some of these authors speak more or less fully of their own education as does Marcus Aurelius in the opening book of his *Meditations*, Augustine in his *Confessions*, Descartes in his *Discourse* and Boswell. Others refer to their educational experience in fictional guise as does Aristophanes in the argument in the *Clouds* between the Just and Unjust Discourses or Rabelais when he tells of Gargantua's school in Gargantua's letter to Pantagruel. Sometimes they report the way in which other men were trained to greatness as does Plutarch or like Gibbon, Hegel and Mill they describe and comment on the historic systems of education.

In still other instances the great books contain sections or chapters devoted to the ends and means of education, the order of studies, the nature of learning and teaching, the training of statesmen and citizens as for example

Plato's *Republic*, Aristotle's *Politics*, Augustines *Christian Doctrine*, Bacon's *Advancement of Learning*, Adam Smith's *Wealth of Nations*, Hegel's *Philosophy of Right*, and the psychological writings of James and Freud. But in so far as education is the principal theme of these books, as it is for most of the works cited in the list of Additional Readings among which will be found treatises on education by authors in this set.

EDUCATION is not itself so much an idea or a subject matter as it is a theme to which the great ideas and the basic subject matters are relevant. It is one of the perennial practical problems which men cannot discuss without engaging in the deepest speculative considerations. It is a problem which carries discussion into and across a great many subject matters—the liberal arts of grammar, rhetoric and logic, psychology, medicine, metaphysics and theology, ethics, politics and economics. It is a problem which draws into focus many of the great ideas—virtue and truth, knowledge and opinion, art and science, desire, will, sense, memory, mind, habit, chance and progress, family and state, man, nature and God.

This can be verified by noting the diverse contexts in which education is discussed in the great books. In each connection we shall find some of the special questions which together make up the complex problem of education. For example, the nature of teaching and learning is examined in the wider context of psychological considerations concerning man's abilities, the way in which knowledge is acquired, and how it is communicated by means of language or other symbols. Different conceptions of the nature of man and of the relation of his several capacities surround the question of the ends of education. In this context

In the classification of the kinds of education, the word "liberal" is frequently used in a more restricted sense to signify not all education designed for free men, but only the improvement of the mind through the acquisition of knowledge and skill. In this sense liberal education is set apart from physical education which concerns bodily health and proficiency and moral education which concerns excellence in action rather than in thought.

These distinctions are clearly made perhaps for the first time in Plato's *Republic*. The education described there begins in the early years with music and gymnastic. Gymnastic "presides over the growth and decay of the body." Music which includes literature as well as the arts of harmony and rhythm is said to educate its students "by the influence of habit by harmony making them harmonious, by rhythm rhythmical" and its function is to develop moral as well as aesthetic sensibilities.

The second part of Plato's curriculum "which leads naturally to reflection" and draws the soul towards being consists in the mathematical arts and sciences of arithmetic, geometry, music and astronomy. The program is capped by the study of dialectic to which all the rest is but "a prelude" for when a person starts on the discovery of the absolute by the light of reason only and without any assistance of sense and perception until by pure intelligence he arrives at the perception of the absolute good he at last finds himself at the end of the intellectual world."

Up to this point the program can be taken as liberal education in the narrow sense of learning how and what to think. The fifteen years of experience in civic affairs and the tasks of government which Plato interposes at the age of thirty five seem to function as another phase of moral training. This period provides an opportunity of trying whether when they are drawn all manner of ways by temptation they will stand firm or flinch.

To the extent that physical training aims beyond health at the acquirement of skill in a coordinated use of one's body it can be argued to be liberal rather than moral education. Plato notes for example that gymnastic should not be too sharply distinguished from music as the training of the body from the train-

ing of the soul. Gymnastic as well as music he claims, has in view chiefly the improvement of the soul and he considers the two as balancing and tempering one another.

Whether they produce competence in gymnastic or athletic feats or like the manual arts proficiency in productive work all bodily skills, even the simplest involve the senses and the mind as well as bones and muscles. They are arts no less than music or logic. Apart from their utility they represent a certain type of human excellence which will be denied only by those who can see no difference between the quality of a racehorse and the skill of his rider. Whether these skills as well as other useful arts are part of liberal education in the broader sense depends, as we have seen on the end for which they are taught or learned. Even the arts which are traditionally called liberal, such as rhetoric or logic can be degraded to servility if the sole motive for becoming skilled in them is wealth won by success in the law courts.

In the two traditional distinctions so far discussed "liberal education" seems to have a somewhat different meaning when it signifies the opposite of servile training and when it signifies the opposite of moral cultivation. In the first case the distinction is based upon the purpose of the education; in the second it refers to the faculties or functions being cultivated. When the second is stated in terms of the distinction between the intellectual and the moral virtues liberal (i.e. intellectual) education is conceived as aiming at good habits of thinking and knowing and moral education is thought of as aiming at good habits of will desire or emotion along with their consequences in action.

Although he does not use these terms, Montaigne seems to have the contrast between moral and intellectual training in mind when he criticizes the education of his day for aiming at nothing, but to furnish our heads with knowledge but not a word of judgment or virtue. It is, to him a "pedantic education which not only fails to achieve the highest educational purpose but also results in a great evil in that all knowledge is hurtful to him who has not the science of goodness."

A too sharp separation of the intellect

treatise *On Christian Doctrine* he considers in detail how the liberal arts which serve so well in the study of Sacred Scripture may also serve to bring the soul to God.

SUCH DIFFERENCES DO NOT however annul one consequence of the general agreement namely the conception that education is concerned with the vocation of man and prepares him in thought and action for his purpose and station in life. In these terms Adam Smith argues for a minimum general education. He claims that a man without the proper use of the intellectual faculties of a man is if possible more contemptible than even a coward and seems to be mutilated and deformed in a still more essential part of the character of human nature. He explicitly points out that this is the condition of the great body of the people who by the division of labor are confined in their employment to a few very simple operations in which the worker has no occasion to exert his understanding or to exercise his invention in finding out expedients for removing difficulties which never occur. The result according to Smith is that the torpor of his mind renders him not only incapable of relishing or bearing a part in any rational conversation but of conceiving any generous noble or tender sentiment and consequently of forming any just judgment concerning many even of the ordinary duties of private life.

When the vocation of man is thus understood a general or liberal education is vocational in that it prepares each man for the common conditions and callings of human life. In this sense specialized training which by implication at least seems to be the object of Smith's criticism is not vocational. It fits a man only for some specialized function according to which he or his social class is differentiated from some other man or class.

In our day the word "vocational" is used in the opposite sense to mean specialized training whether it is preparation for the least skilled of trades or for the most learned of professions. Since all men are not called to the practice of law or medicine—any more than all are called to productive work in the various arts and crafts or the tasks of commerce and

industry—the training they may need to perform these functions does not fully develop their common humanity. It is not adequate to make them good as men as citizens or as children of God.

The traditional meaning of the word "liberal" as applied to education entails a distinction between free men and slaves. Slaves like domesticated animals are trained to perform special functions. They are not treated as ends but as means and so they are not educated for their own good but for the use to which they are put. This is true not only of slaves in the strict sense of household chattel; it is also true of all the servile classes in any society which divides its human beings into those who work in order to live and those who live off the work of others and who therefore have the leisure in which to strive to live well.

In accordance with these distinctions Aristotle divides education into liberal and illiberal. Certain subjects are illiberal by nature namely any occupation art or science which makes the body or soul of the freeman less fit for the practice or exercise of virtue." In this category Aristotle includes those arts which tend to deform the body and likewise all paid employments for they absorb and degrade the mind.

It is not only the nature of the subject but also the end which education serves that determines whether its character is liberal or illiberal. Even a liberal art becomes in Aristotle's opinion menial and servile if done for the sake of others. A man's education will not appear illiberal only so long as he does or learns anything for his own sake or for the sake of his friends or with a view to excellence. In other words to be liberal education must serve the use of leisure in the pursuit of excellence. It must treat man as an end not as a means to be used by other men or by the state.

It follows that any society which abolishes the distinction of social classes and which calls all men to freedom should conceive education as essentially liberal and for all men. It should furthermore direct education in all its parts and phases to the end of each man's living well rather than to the end of his earning a living for himself or others.

IN THE CLASSIFICATION of the kinds of education, the word liberal is frequently used in a more restricted sense to signify not all education deserved for free men but only the improvement of the mind through the acquisition of knowledge and skill. In this sense liberal education is set apart from physical education which concerns bodily health and proficiency and moral education which concerns excellence in action rather than in thought.

These divisions are clearly made perhaps for the first time in Plato's *Republic*. The education described there begins in the early years with music and gymnastic. Gymnastic presides over the growth and decay of the body. Music which includes literature as well as the arts of harmony and rhythm is said to educate its students by the influence of habit by harmonizing them harmonious by rhythm rhythmical and its function is to develop moral as well as aesthetic sensibilities.

The second part of Plato's curriculum which leads naturally to reflection and draws the soul towards being consists in the mathematical arts and sciences of arithmetic geometry music and astronomy. The program is topped by the study of dialectic to which all the rest is but a prelude for when a person starts on the discovery of the absolute by the light of reason only and without any assistance of sense and perseveres until by pure intelligence he arrives at the perception of the absolute good he at last finds himself at the end of the intellectual world.

Up to this point the program can be taken as liberal education in the narrow sense of learning how and what to think. The fifteen years of experience in civic affairs and the trials of government which Plato interposes at the age of thirty five seem to function as another phase of moral training. This period provides an opportunity of trying whether when they are drawn all manner of ways by temptation they will stand firm or flinch.

To the extent that physical training aims beyond health at the acquirement of skill in a coordinated use of one's body it can be an end to liberal rather than moral education. Plato notes for example that gymnastic should not be too sharply distinguished from music as the training of the body from the train-

ing of the soul. Gymnastic as well as music he claims has in view chiefly the improvement of the soul and he considers the two as balancing and tempering one another.

Whether they produce competence in gymnastic or athletic feats or like the manual arts proficiency in productive work all bodily skills even the simplest involve the senses and the mind as well as bones and muscles. They are arts no less than music or logic. Apart from their utility they represent a certain type of human excellence which will be denied only by those who can see no difference between the quality of a racehorse and the skill of his rider. Whether these skills as well as other useful arts are part of liberal education in the broader sense depends, as we have seen on the end for which they are taught or learned. Even the arts which are traditionally called liberal such as rhetoric or logic can be degraded to servility if the sole motive for becoming skilled in them is wealth won by success in the law courts.

IN THE TWO TRADITIONAL dimensions so far discussed liberal education seems to have a somewhat different meaning when it signifies the opposite of servile training, and when it signifies the opposite of moral cultivation. In the first case the distinction is based upon the purpose of the education; in the second it refers to the faculties or functions being cultivated. When the second is stated in terms of the distinction between the intellectual and the moral virtues liberal (i.e. intellectual) education is concerned as aiming at good habits of thinking and knowing and moral education is thought of as aiming at good habits of will desire or emotion along with their consequences in action.

Although he does not use these terms, Montaigne seems to have the contrast between moral and intellectual training in mind when he criticizes the education of his day for aiming at nothing but to furnish our heads with knowledge but not a word of judgment and virtue. It is, to him a "pedantic education which not only fails to achieve the highest educational purpose but also results in a great evil in that all knowledge is hurtful to him who has not the science of goodness."

A too sharp separation of the intellectual

treatise *On Christian Doctrine* he considers in detail how the liberal arts which serve so well in the study of Sacred Scripture may also serve to bring the soul to God

Such DIFFERENCES DO NOT however annul one consequence of the general agreement namely the conception that education is concerned with the vocation of man and prepares him in thought and action for his purpose and station in life In these terms Adam Smith argues for a minimum general education He claims that a man without the proper use of the intellectual faculties of a man is if possible more contemptible than even a coward and seems to be mutilated and deformed in a still more essential part of the character of human nature He explicitly points out that this is the condition of the great body of the people who by the division of labor are confined in their employment to a few very simple operations in which the worker has no occasion to exert his understanding or to exercise his invention in finding out expedients for removing difficulties which never occur The result according to Smith is that the torpor of his mind renders him not only incapable of relishing or bearing a part in any rational conversation but of conceiving any generous noble or tender sentiment and consequently of forming any just judgment concerning many even of the ordinary duties of private life

When the vocation of man is thus understood a general or liberal education is vocational in that it prepares each man for the common conditions and callings of human life In this sense specialized training which by implication at least seems to be the object of Smith's criticism is not vocational It fits a man only for some specialized function according to which he or his social class is differentiated from some other man or class

It follows that any society which abolishes the distinction of social classes and which calls all men to freedom should conceive education as essentially liberal and for all men It should furthermore direct education in all its parts and phases to the end of each man's living well rather than to the end of his earning a living for himself or others

toms. All of these related problems of moral education have a political aspect which appears in the issue concerning the state's right to censor or regulate the arts for morality's sake in the question of the primacy of the family or the state in the moral guidance of the young in the distinction between the good man and the good citizen or ruler and the possible difference between the training appropriate for the one and for the other.

The next problem of intellectual education seems to be the curriculum or course of study. The traditional attempts to construct an ideal curriculum turn on such questions as what studies shall be included, what shall be their order and how shall they be taught or learned? A variety of answers results from a variety of views of man's faculties or capacities, the nature of knowledge itself, the classification and order of the arts and sciences. Especially important are the various conceptions of the nature and function of the liberal arts. Subordinate questions concern the place of the fine and useful arts in liberal education and the role of experience and experiment—both in contrast to and in cooperation with the role of books and teachers.

In addition to the problem of the curriculum and its materials, the theory of intellectual education necessarily considers methods of teaching and learning. Here the various proposals derive from different views of the learning process—or the causes or factors at work in any acquisition of skill or knowledge.

The contribution of the teacher cannot be understood apart from a psychological analysis of learning for the teacher is obviously only one among its many causes. It makes the greatest difference to the whole enterprise of learning whether the teacher is regarded as the principal cause of understanding on the part of the student or whether the teacher is as Socrates describes himself merely a midwife assisting the labor of the mind in bringing knowledge and wisdom to birth and thoroughly examining whether the thought which the mind brings forth is a false idol or a noble and true birth.

This Socratic insight is later reformulated in the comparison which Aquinas makes, in his

tract *Concerning the Teacher* between the art of teaching and the art of healing. Both are co-operative arts, arts which succeed only as ministers of nature which is the principal actor and not by acting like the art of the cobbler or sculptor to produce a result by shaping plastic but dead materials.

The comparison which Hippocrates makes of instruction in medicine with "the culture of the products of the earth" exhibits the same conception of teaching. Our natural disposition he writes is as it were the soil, the tenets of our teacher are as it were the seed; instruction in youth is like the planting of the seed in the ground at the proper season; the place where the instruction is communicated is like the soil imparted to vegetables by the atmosphere; diligent study is like the cultivation of the fields; and it is time which imparts strength to all things and brings them to maturity.

This conception of teaching as a cooperative art analogous to medicine or to agriculture underlies the principles of pedagogy in the *Creat Didactic* of Comenius. It gives significance to the distinction that Aquinas makes between learning by discovery or from experience and learning by instruction or from a teacher—even as a person is healed in one way by the operation of nature alone and in another by nature with the administration of medicine.

In addition to the technical considerations raised by the nature of the learning process the discussion of teaching deals with the moral or emotional aspect of the relation between teacher and student. Without interest learning seldom takes place or if it does it cannot rise above the level of rote memory. It is one thing to lay down a course of study, another to motivate the student. Though he does not hesitate to prescribe what is to be learned by the student, Plato adds the caution that there must be no notion of forcing our system of education.

More than interest is required. Teaching Augustine declares is the greatest act of charity. Learning is facilitated by love. The courtesies between Dante and Virgil in the *Divine Comedy* present an eloquent picture of love between student and teacher master and dis-

and the moral may be questioned or at least qualified by those who like Socrates tend to identify knowledge and virtue. Yet they seldom go to the opposite extreme of supposing that no distinction can be made between the task of imparting knowledge to the mind and that of forming character. Socrates for example in the *Meno* recognizes that a man cannot be made temperate, courageous or just in the same way that he can be taught geometry.

From another point of view the notion of moral training is questioned by those who like Freud think that the patterns of human desire or emotion can be beneficially changed apart from moral discipline. It is the object of psychoanalysis he writes to strengthen the ego to make it more independent of the super ego to widen its field of vision and so to extend its organization that it can take over new portions of the id. To do this is radically to alter the individual's behavior pattern. It is reclamation work. Freud says like the draining of the Zuider Zee. Emotional education so conceived is therapeutic—more like preventive and remedial medicine than moral training.

Religious education is usually regarded as both intellectual and moral even as the science of theology is said to be both speculative and practical. Citing the admonition of St. James

Be ye doers of the word and not hearers only Aquinas holds that religious education is concerned with the knowledge not only of divine things but also of the human acts by which man comes to God. Since man is infinitely removed from God he needs for this purpose the grace of God which according to Aquinas is nothing short of a partaking of the divine nature.

Both on the side of man's knowledge of God and on the side of his love and worship of God religious education involves the operation of supernatural factors—revelation, grace, sacraments. Hence God is Himself the primary source of religious education. But as the dispenser of the sacraments whereby grace is instrumentally caused the church according to Aquinas functions instrumentally in the service of the divine teacher.

THE CONCEPTION OF THE means and ends of moral education will differ with different ethi-

cal theories of the good man and the good life and according to differing enumerations and definitions of the virtues. It will differ even more fundamentally according to whether the primary emphasis is placed on pleasure and happiness or duty. The parties to this basic issue in moral philosophy which is discussed in the chapters on *Duty and Happiness* inevitably propose different ways of forming good character—by strengthening the will in obedience to law or by habituating the appetites to be moderate or reasonable in their inclinations.

On either theory the basic problem of moral education is whether morality can be taught and how. The Greeks formulated this question in terms of virtue by asking whether such things as courage and temperance are at all teachable as geometry and horsemanship plainly are. The problem remains essentially the same if the question is how the will can be trained. Can it be trained by the same methods as those which work in the improvement of the understanding?

The answer to the question whichever way it is formulated depends on the view that is taken of the relation between moral knowledge and moral conduct. Do those who understand the principles of ethics or who know the moral law necessarily act in accordance with their knowledge? Can a man know what is good or right to do in a particular case and yet do the opposite? St. Paul seems to suggest this when he says For the good that I would I do not but the evil which I would not that I do. If something more than knowledge or straight thinking is needed for good conduct how is it acquired and how can one man help another to acquire it? Certainly not by learning and teaching in the ordinary sense which applies to the arts and sciences. Then how—by practice by guidance or advice by example by rewards and punishments or if by none of these then by a gift of nature or by the grace of God?

These questions are necessarily prior to any discussion of the role of the family, the state and the church in the process of moral training. They also provide the general background for the consideration of particular influences on character formation in men and children such things as poetry and music or laws and cus-

tion. All of these related problems of moral education have a practical aspect which appears in the issue concerning the state's right to censor or regulate the arts for morality's sake in the question of the primacy of the family, or the state in the moral guidance of the young, in the distinction between the good man and the good citizen or ruler, and the possible difference between the training appropriate for the one and for the others.

The main problem of intellectual education seems to be the curriculum or course of study. The traditional attempts to construct an ideal curriculum turn on such questions as what studies shall be included, what shall be their order and how shall they be taught or learned? A variety of answers results from a variety of views of man's faculties or capacities, the nature of knowledge itself, the classification and order of the arts and sciences. Especially important are the various conceptions of the nature and function of the liberal arts. Subordinate questions concern the place of the fine and useful arts in liberal education and the role of experience and experiment—both in contrast to and in cooperation with the role of books and teachers.

In addition to the problem of the curriculum and its materials, the theory of intellectual education necessarily considers methods of teaching and learning. Here the various proposals derive from different views of the learning process—or the causes or factors at work in any acquisition of skill or knowledge.

The contribution of the teacher cannot be understood apart from a psychological analysis of learning for the teacher is obviously only one among its many causes. It makes the greatest difference to the whole enterprise of learning whether the teacher is regarded as the principal cause of understanding on the part of the student or whether the teacher is, as Socrates describes himself merely a midwife assisting the labor of the mind in bringing knowledge and wisdom to birth and thoroughly examining whether the thought which the mind brings forth is a false idol or a noble and true birth.

This Socratic insight later reformulated in the comparison which Aquinas makes in his

tract *Contra Conscientiam, the Teacher* between the art of teaching and the art of healing. Both are cooperative arts, arts which succeed only as ministers of nature, which is the principal actor and not by acting like the art of the cobbler or sculptor to produce a result by shaping plastic but dead materials.

The comparison which Hippocrates makes of instruction in medicine with the culture of the productions of the earth exhibits the same conception of teaching. Our natural disposition he writes is as it were the soil, the tenets of our teacher are as it were the seed. Instruction in youth is like the planting of the seed in the ground at the proper season, the place where the instruction is communicated is like the food imparted to vegetables by the atmosphere; diligent study is like the cultivation of the fields; and it is time which imparts strength to all things and brings them to maturity.

This conception of teaching as a cooperative art analogous to medicine or to agriculture underlies the principles of pedagogy in the *Creat Didactic* of Comenius. It gives significance to the distinction that Aquinas makes between learning by discovery or from experience and learning by instruction or from a teacher—even as a person is healed in one way by the operation of nature alone and in another by nature with the administration of medicine.

In addition to the technical considerations raised by the nature of the learning process, the discussion of teaching deals with the moral or emotional aspect of the relation between teacher and student. Without interest, learning seldom takes place or if it does it cannot rise above the level of rote memory. It is one thing to lay down a course of study, another to motivate the student. Though he does not hesitate to prescribe what is to be learned by the student, Plato adds the caution that there must be no notion of forcing our system of education.

More than interest is required. Teaching, Augustine declares, is the greatest act of charity. Learning is facilitated by love. The courtesies between Dante and Virgil in the *Dante Comedy* present an eloquent picture of love between student and teacher, master and dis-

ciple Not only love but docility is required on the part of the student and respect for the student's mind on the part of the teacher In intellectual education may not be directly concerned with the formation of character yet the moral virtues seem to be factors in the pursuit of truth and in the discipline of the learning process

WE HAVE ALREADY noted some of the political problems of education Of these probably the chief question is whether the organization and institution of education shall be private or public Any answer which assigns the control of education largely or wholly to the state must lead to a number of other determinations

*Who shall be educated all or only some?* Should the education of leaders be different from the education of others? If educational opportunity is to be equal for all must the same kind as well as the same quantity of education be offered to all? And in every case to what end shall the state direct the education of its members—to its own welfare and security or to the happiness of men and the greater glory of God? Should education always serve the status quo by preserving extant customs and perpetuating existing forms of government or can and should it aim at a better society and a higher culture?

These are some of the questions with which statesmen and political philosophers have dealt answering them differently according to the institutions of their time and in accordance with one or another theory of the state and its government There are still other questions Is freedom of expression in teaching and discussion indispensable to the pursuit of truth and the dissemination of knowledge? To what extent shall the state control the content and methods of education or leave such determination to the teaching profession? How shall public education be supported? Should it be carried beyond childhood and youth to all the ages of adult life and if so how should such education be organized outside of schools?

Mill for example holds it to be almost a self-evident axiom that the State should require and compel the education up to a certain standard of every human being who is born

its citizen Yet he deprecates the idea of a general state education as a mere contrivance for moulding people to be exactly like one another

Discussing the pros and cons of this issue Mill touches upon most if not all of the questions just raised He believes that the difficulties could be avoided if the government would leave it to parents to obtain the education where and how they pleased and content itself with helping to pay the school fees of the poorer classes of children and defraying the entire school expenses of those who have no one else to pay for them Schools completely established and controlled by the state he maintains should only exist if they exist at all as one among many competing experiments, carried on for the purpose of example and stimulus to keep the others up to a certain standard of excellence

So far as the problem of adult education concerns citizenship Mill's answer like Montesquieu's and Plato's before him is that nothing can take the place of active participation in political life Men become citizens by living and acting as citizens, under the tutelage of good laws and in an atmosphere of civic virtue So far as the problem of adult education concerns the continued growth of the mind throughout the life of mature men and women the answer is not to be found in the great books in the words of their authors Yet the great books as a whole may constitute a solution to that problem

The authors of these books from Homer to Freud are the great original teachers in the tradition of our culture They taught one another They wrote for adults not children and in the main they wrote for the mass of men not for scholars in this or that specialized field of learning

The books exhibit these teachers at work in the process of teaching They contain moreover expositions or exemplifications of the liberal arts as the arts of teaching and learning in every field of subject matter To make these books and their authors work for us by working with them is it seems to the editors and publishers of this set of books a feasible and desirable program of adult education

## OUTLINE OF TOPICS

	P. GS
1 The ends of education	384
1a The ideal of the educated man	385
1b The disadvantages of being educated	
2 The kinds of education physical moral liberal professional religious	386
3 The training of the body and the cultivation of bodily skills gymnastics manual work	
4 The formation of a good character virtue a right will	
4a The possibility and limits of moral education knowledge and virtue	387
4b The influence of the family in moral training	388
4c The role of the state in moral education law custom public opinion	
4d The effect upon character of poetry music and other arts the role of history and examples	389
5 The improvement of the mind by teaching and learning	390
5a The profession of teaching the relation of teacher and student	
5b The means and methods of teaching	
5c The nature of learning its several modes	391
5d The order of learning the organization of the curriculum	392
5e The emotional aspect of learning pleasure desire interest	
5f Learning apart from teachers and books the role of experience	393
6 The acquisition of techniques preparation for the vocations arts, and professions	394
, Religious education	
7a God as teacher divine revelation and inspiration	
7b The teaching function of the church of priests and prophets	395
8 Education and the state	396
8 The educational responsibility of the family and the state	
8b The economic support of educational institutions	
8c The political regulation and censorship of education	
8d The training of the prince the statesman the citizen aristocratic and democratic theories of education	
9 Historical and biographical observations concerning the institutions and practices of education	
	397

ciple Not only love but docility is required on the part of the student and respect for the student's mind on the part of the teacher In teleological education may not be directly concerned with the formation of character yet the moral virtues seem to be factors in the pursuit of truth and in the discipline of the learning process

WE HAVE ALREADY noted some of the political problems of education Of these probably the chief question is whether the organization and institution of education shall be private or public Any answer which assigns the control of education largely or wholly to the state must lead to a number of other determinations

Who shall be educated all or only some? Should the education of leaders be different from the education of others? If educational opportunity is to be equal for all must the same kind as well as the same quantity of education be offered to all? And in every case to what end shall the state direct the education of its members—to its own welfare and security or to the happiness of men and the greater glory of God? Should education always serve the status quo by preserving extant customs and perpetuating existing forms of government or can and should it aim at a better society and a higher culture?

These are some of the questions with which statesmen and political philosophers have dealt answering them differently according to the institutions of their time and in accordance with one or another theory of the state and its government There are still other questions Is freedom of expression in teaching and discussion indispensable to the pursuit of truth and the dissemination of knowledge? To what extent shall the state control the content and methods of education or leave such determination to the teaching profession? How shall public education be supported? Should it be carried beyond childhood and youth to all the ages of adult life and if so how should such education be organized outside of schools?

Mill for example holds it to be almost a self evident axiom that the State should require and compel the education up to a certain standard of every human being who is born

its citizen Yet he deprecates the idea of a general state education as a mere contrivance for moulding people to be exactly like one another

Discussing the pros and cons of this issue Mill touches upon most if not all of the questions just raised He believes that the difficulties could be avoided if the government would leave it to parents to obtain the education where and how they pleased and content itself with helping to pay the school fees of the poorer classes of children and defraying the entire school expenses of those who have no one else to pay for them Schools completely established and controlled by the state he maintains should only exist if they exist at all as one among many competing experiments carried on for the purpose of example and stimulus to keep the others up to a certain standard of excellence

So far as the problem of adult education concerns citizenship Mill's answer like Montesquieu's and Plato's before him is that nothing can take the place of active participation in political life Men become citizens by living and acting as citizens under the tutelage of good laws and in an atmosphere of civic virtue So far as the problem of adult education concerns the continued growth of the mind throughout the life of mature men and women the answer is not to be found in the great books in the words of their authors Yet the great books as a whole may constitute a solution to that problem

The authors of these books from Homer to Freud are the great original teachers in the tradition of our culture They taught one another They wrote for adults not children and in the main they wrote for the mass of men not for scholars in this or that specialized field of learning

The books exhibit these teachers at work in the process of teaching They contain more or less expositions or exemplifications of the liberal arts as the arts of teaching and learning in every field of subject matter To make these books and their authors work for us by working with them is it seems to the editors and publishers of this set of books a feasible and desirable program of adult education

## REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example in **4 HOMER Iliad** BK II [62-283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12.

**PAGE SECTIONS** When the text is printed in one column the letters **a** and **b** refer to the upper and lower halves of the page. For example in **53 JAMES Psychology** 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns the letters **a** and **b** refer to the upper and lower halves of the left hand side of the page the letters **c** and **d** to the upper and lower halves of the right hand side of the page. For example in **7 PLATO Symposium** 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

**AUTHOR'S DIVISIONS** One or more of the main divisions of a work (such as **PART**, **BK**, **CH**, **SECT**) are sometimes included in the reference line numbers in brackets are given in certain cases e.g. **Iliad** BK II [265-283] 12d

**BIBLE REFERENCES** The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e.g. **Old Testament Nehemiah** 7:45—(D) **II Esdras** 7:46

**SYMBOLS** The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference. pssm signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface.
